PT   New antisense compound targeted to a nucleic acid molecule encoding
PT   transcription factor-2 gamma, useful for inhibiting expression of the
PT   nucleic acid, and for treating cancer e.g. breast cancer or colon cancer.
XX
PS   Claim 3; Page 80; 107pp; English.
XX
CC   The invention relates to antisense compounds, compositions and methods
CC   for modulating the expression of transcription factor-2 gamma (TFAP2C).
CC   TFAP2C is also known as AP-2 gamma, AP2-gamma, AP-2.2, Stra2, activating
CC   enhancer-binding protein 2 gamma, oestrogen receptor factor-1 and ERF-1.
CC   The invention is useful for inhibiting the expression of TFAP2C in cells
CC   or tissues. It is useful for treating an animal having a disease or
CC   condition associated with TFAP2C, e.g., a hyperproliferative disorder
CC   such as cancer e.g. breast cancer or colon cancer and a developmental
CC   disorder. The invention is also useful for diagnostics, therapeutics,
CC   prophylaxis and as research reagents and kits. It is also used in
CC   antisense therapy. The present sequence is an antisense oligonucleotide
CC   targetted to human TFAP2C DNA. This sequence is used to illustrate the
CC   method of the invention

CC   The invention relates to antisense compounds, compositions and methods
CC   for modulating the expression of transcription factor-2 gamma (TFAP2C).
CC   TFAP2C is also known as AP-2 gamma, AP2-gamma, AP-2.2, Stra2, activating
CC   enhancer-binding protein 2 gamma, oestrogen receptor factor-1 and ERF-1.
CC   The invention is useful for inhibiting the expression of TFAP2C in cells
CC   or tissues. It is useful for treating an animal having a disease or
CC   condition associated with TFAP2C, e.g., a hyperproliferative disorder
CC   such as cancer e.g. breast cancer or colon cancer and a developmental
CC   disorder. The invention is also useful for diagnostics, therapeutics,
CC   prophylaxis and as research reagents and kits. It is also used in

```

XX
CC This sequence represents a PCR primer, #5, used in a second round of PCR
CC amplification of a cDNA. The cDNA had previously been amplified by a
CC first round of PCR from cDNA produced by reverse transcription of RNA
CC which had been generated after 3' gene trapping. The amplified cDNA was
CC then sequenced to obtain the gene trapped sequence. Such gene trapping
CC can be used to acquire novel sequence information from the trapped exons,
CC useful to identify new genes and in screening e.g., to identify the
CC genetic basis of diseases (such as cancer) or phenotypes, especially in
CC the analysis of single nucleotide polymorphisms. The vector can also be
CC introduced into a cell to activate expression of a naturally occurring
CC cellular gene, useful to study gene function. They can be used to produce
CC mutated cells or animals, and are useful in screening, for example, to
CC identify mutations associated with tumorigenic phenotypes. They can also
CC be used to create cDNA libraries of cells, useful for large scale genetic
CC analysis of the genome and to identify novel and mutated genes. The
CC vectors are more efficient (e.g., their use identified 13-fold more
CC genes) than conventional 3' gene trap vectors that rely on gene trapping
CC as detected by antibiotic selection. Use of vectors incorporating 5' gene
CC trap cassettes increase the probability of identifying the 5' ends of
CC gene open reading frames, important because these are difficult to obtain
CC by conventional methods, and often code for the signal sequence in
CC secreted and transmembrane proteins, an important group for potential
CC drug targets

PT Recombinant vectors for use in, for example, gene discovery, gene cloning
PT and gene mutation.
XX
PS Example 2; Page 62; 78pp; English.
XX
CC A 3' gene trapping vector was constructed containing the murine
CC phosphoglycerate kinase (PGK) gene promoter, the first exon of the murine
CC btk gene (nucleotides 40043-40250) and a splice donor (SD) sequence. The
CC PGKbtkSD vector lacks a 3' polyadenylation signal. Any transcript
CC produced by the cassette cannot be properly processed, and therefore
CC identified by 3' RACE, unless it is spliced to a 3' exon that can be
CC polyadenylated. The btk vector was introduced into embryonic stem cells
CC and G418 resistant cells were subsequently isolated and subjected to RNA
CC isolation, reverse transcription, PCR and sequencing to obtain the gene
CC trapped sequences. The claimed genetically engineered vectors comprise 5'
CC and 3' gene trap cassettes. The vectors incorporate structural elements
CC which, after integration into the host cell genome, enhance the number of
CC cellular genes that can be identified and mutated. A 5' gene trap
CC cassette comprises a splice acceptor (SA), an exon sequence (Ex1) located
CC 3' to the SA, which encodes a marker enabling the identification of a
CC cell expressing the exon and a polyadenylation sequence defining the 3'
CC end of Ex1. The vectors may be used for gene discovery, gene cloning,
CC gene mutation, gene regulation, shuttling nucleic acid sequences
CC throughout the genome and gene activation and over expression. The
CC vectors can be used to trap genes with a high level of efficiency
CC regardless of whether the genes are normally expressed in the cell type
CC into which the vector is incorporated. Cells harboring the vectors can be
CC screened using automated gene identification assays such as 3' RACE.
CC Using these vectors, it is possible to produce large numbers of mutations
CC and rapidly identify the mutated or trapped genes

XX
PS   Example 1; SEQ ID NO 3; 35pp; English.
XX
CC   The invention relates to a method of detecting a nucleic acid sequence
CC   variation. The method is useful for detecting single-nucleotide
CC   polymorphisms or insertions or deletions of less than 10 bases in
CC   mammalian DNA (especially human), where the insertion or deletion is less
CC   than 5 % of the total sequence of the nucleic acid, in order to diagnose
CC   genetic diseases, especially sickle cell anaemia, diabetes, Alzheimer's
CC   disease, Huntington's disease, breast cancer, retinoblastoma, cystic
CC   fibrosis, Factor VIII haemophilia, Duchenne/Becker muscular dystrophy,
CC   Type 1 von Willebrand disease, familial Alzheimer's disease, familial
CC   hypercholesterolaemia, or a disease resulting from a mutation in nucleic
CC   acid encoding the low-density lipoprotein receptor. The present sequence
CC   represents a polymorphism containing DNA fragment of human HTR2A.

PT   Nucleic acids encoding human kinase polypeptides, useful for preventing
PT   diagnosing and/or treating e.g. cancer, immune, cardiovascular and
PT   neuronal-associated diseases, and microbial infections.
XX
PS   Example 2C; Page 298; 433pp; English.
XX
CC   AAS06778-AAS06827 represent PCR primers used to amplify human cDNA
CC   sequences encoding for novel protein kinases (AAU03501-AAU03557). The
CC   novel protein kinases have been identified as members of the tyrosine or
CC   serine/threonine kinase (PTK and STK) families. The polynucleotides
CC   encoding protein kinases and the polypeptides may be used in the
CC   prevention, diagnosis and treatment of diseases associated with
CC   inappropriate kinase expression. For example, they may be used to treat
CC   cancers (especially cancers of haematopoietic origin), cardiovascular
CC   disease (e.g. atherosclerosis), metabolic disorders (e.g. diabetes),
CC   immune related diseases (e.g. rheumatoid arthritis), neurological
CC   disorders (e.g. schizophrenia), neurodegenerative disorders (e.g.
CC   Parkinson's disease), inflammatory disorders (e.g. asthma), infectious
CC   disease (e.g. HIV) and reproductive disorders (e.g. infertility).
CC   Additionally, polynucleotides encoding protein kinases may be used for
CC   gene therapy and as DNA probes in diagnostic assays. The protein kinase
CC   polypeptides may be used as antigens in the production of antibodies
CC   against the protein kinases and in assays to identify modulators of
CC   protein kinase expression and activity

PT   New array of nucleic acid probes, useful for in situ hybridization, in
PT   Southern, Northern or dot-blot hybridization to identify or detect the
PT   sequence or specific mutations of any gene.
XX
PS   Claim 1; SEQ ID NO 3329; 9pp; English.
XX
CC   The invention discloses a microarray comprising a plurality of nucleic
CC   acid probes including one of 2,018,500 fully defined sequences, or its
CC   perfect match, perfect mismatch, antisense match or antisense mismatch.
CC   Also disclosed is a method of gene expression analysis. The array is used
CC   in monitoring gene expression levels by hybridisation to a DNA library,
CC   in analysis of genetic variation or in hybridisation of tag-labelled
CC   compounds. The nucleic acid probes are specifically designed for analysis
CC   of at least one target sequence. The method of analysis comprises
CC   hybridising at least one or more nucleic acids to at least two or more
CC   nucleic acid probes and detecting the hybridisation. The nucleic acid
CC   probes are attached to a solid support. The analysis comprises monitoring
CC   gene expression levels, identifying biallelic markers or polymorphisms,
CC   or family members of a gene and a cross-species comparison. Each of the
CC   nucleic acids further comprises a tag sequence. The array of nucleic acid
CC   probes is useful in in situ hybridisation, in Southern, Northern or dot-
```

PT   PDK-53, a clone of infectious attenuated Dengue 2 virus strain 16681 -
PT   also chimeric DEN-2/1, DEN-2/3 and DEN-1/4 viruses, used as a
PT   quadravalent vaccine for protecting against Dengue virus infection.
XX
PS   Example; Page 104; 261pp; English.
XX
CC   The sequences given in AAT75909-T76029 are primers which were used in the
CC   amplification, cloning and sequencing of the Dengue-2 viral cDNA's of the
CC   invention. The Dengue 2 viral DNA encodes a polyprotein which comprises
CC   the capsid, prM, M, E, NS1, NS2A, NS2B, NS3, NS4A, NS4B and NS5 proteins.
CC   The quadravalent vaccine of the invention comprises an attenuated Dengue
CC   virus clone, PDK-53, and a chimeric DEN-2/1 virus, a chimeric DEN-2/3
CC   virus, and/or a chimeric DEN-2/4 virus. The new quadravalent vaccines are
CC   used to protect against infection by all four serotypes of dengue virus,
CC   DEN-1, DEN-2, DEN-3 and DEN-4, which can lead to dengue fever or fatal
CC   dengue haemorrhagic fever/dengue shock syndrome (DHF/DSS). Host cells are
CC   used to produce the recombinant protein products of the DNA constructs
CC   which are used in the vaccines

PT   Determining whether a tumor is metastatic, useful for distinguishing
PT   malignant from non-malignant tissue or early stage cancers from
PT   metastatic cancers comprises comparing level of expression of a gene in
PT   the tumor to a control value.
XX
PS   Example; SEQ ID NO 11; 63pp; English.
XX
CC   The present invention relates to determining whether a tumor is
CC   metastatic comprises comparing the level of expression of a gene in the
CC   tumor compared to a control value, where an increase or decrease in the
CC   level of expression in the tumor compared to the control value indicates
CC   that the tumor is metastatic. The method is useful for determining
CC   whether a tumor is metastatic. The method is useful for distinguishing
CC   malignant from non-malignant tissue as well as early stage cancers from
CC   metastatic cancers, particularly those that have undergone lymph node
CC   metastasis. The method is useful for diagnosing intestinal-type gastric
CC   cancer in a subject, for predicting lymph node-negative cancers and lymph
CC   node-positive cancers, useful in screening for a therapeutic agent useful
CC   in treating or preventing intestinal-type gastric cancer, useful for
CC   treating or preventing intestinal-type gastric cancer in a subject. The
CC   method is a sensitive, reliable and powerful tool that facilitates
CC   sensitive, specific and precise diagnosis of intestinal-type gastric
CC   tumors. The present sequence represents a primer of the invention.

PT   New 459 nucleic acids and encoded polypeptides, useful for diagnosing,
PT   treating or preventing a kidney disorder in an organism, or in screening
PT   for compounds that modulate the development of an organism.
XX
PS   Disclosure; Page 82; 347pp; English.
XX
CC   The invention describes an isolated nucleic acid molecule (I) comprising
CC   a sequence having at least 75% sequence identity to the 459 nucleic acid
CC   sequence of 2808 base pairs (SEQ ID NO: 59) given in the specification,
CC   over at least 600 contiguous base pairs, where the nucleic acid functions
CC   in kidney development. (I) is useful for treating or preventing a kidney
CC   disorder in an organism, where the nucleic acid elicits an alteration in
CC   expression of a 459 nucleic acid sequence in the organism and
CC   subsequently treats or prevents a kidney disorder. The nucleic acid may
CC   also be used in diagnosing, preventing and treating a variety of
CC   mammalian diseases and developmental disorders (e.g. circulatory
CC   disorders, hearing disorders, heart defect, infertility, stroke, mental
CC   retardation, muscle defects, proliferative disorders, or bone defects or
CC   disorders) as well as in screening for compounds that modulate the
CC   development of an organism as a whole or of specific tissues or organs
CC   within that organism. This sequence represents a primer used to identify
CC   zebrafish embryos comprising altered kidney development proteins by
CC   detection of RAGI sequences.

PT   autosomal dominant familial spastic paraplegia and in drug screening.
XX
PS   Claim 6; Page 30; 145pp; French.
XX
CC   AAF84871-AAF84902 represent the acceptor and donor sites of the
CC   intron/exon and exon/intron borders of the human SPG4 gene. The SPG4 gene
CC   encodes a spastin polypeptide. The sequences may be used as PCR primers
CC   and probes. Mutations in the SPG4 gene are responsible for autosomal
CC   dominant familial spastic paraplegia. SPG4 polynucleotides, and their
CC   fragments, are used to screen DNA banks for sequences that encode spastin
CC   (particularly sequences in other mammals, specifically mice); to identify
CC   SPG4 mutations, or other genetic anomalies, particularly for diagnosis of
CC   autosomal dominant familial spastic paraplegia (PSF-AD); to identify
CC   promoters and other regulatory elements of the SPG4 gene; for detection
CC   and amplification; for recombinant production of spastin; and for
CC   diagnostic genotyping of PSF-AD

PT   Diagnosing human autoimmune disease by detecting retrovirus with
PT   superantigen activity - new retrovirus associated with type 1 diabetes,
PT   its proviral DNA, and related vectors, transformed cells, proteins,
PT   antibodies and specific binding agents, used for treating or preventing
PT   autoimmune disease.
XX
PS   Example; Page 34; 92pp; English.
XX
CC   The sequence is that of an insulin-dependent diabetes mellitus associated
CC   human endogenous retrovirus (IDDMK1.2-22) PCR primer. The retrovirus has
CC   Superantigen (SAg) activity. It can be used as part of a method is
CC   specifically used to diagnose type 1 diabetes mellitus. Modified proteins
CC   expressed by the retroviral sequence (without SAg activity but still able
CC   to induce an immune response) are useful in vaccines to treat or prevent
CC   SAg-related autoimmune disease; nucleic acid sequences encoding
CC   (modified) SAg can be used similarly to treat such diseases. Retroviral-
CC   encoded SAg are important in pathogenesis of autoimmune disease, probably
CC   by activating autoreactive T cells. The method is very specific (it can
CC   differentiate between expressed and non-expressed viral nucleic acids)
CC   and can be used even where the pathogen is an ubiquitous endogenous
CC   retrovirus. Blood or plasma samples can be tested without extensive
CC   preparation and diagnosis can be made before clinical signs are apparent,
CC   allowing early intervention before severe tissue damage has occurred

PT   Diagnosing human autoimmune disease by detecting retrovirus with
PT   superantigen activity - new retrovirus associated with type 1 diabetes,
PT   its proviral DNA, and related vectors, transformed cells, proteins,
PT   antibodies and specific binding agents, used for treating or preventing
PT   autoimmune disease.
XX
PS   Claim 9; Page 52; 92pp; English.
XX
CC   The sequence is that of an insulin-dependent diabetes mellitus associated
CC   human endogenous retrovirus (IDDMK1.2-22) poly(A) specific primer. The
CC   retrovirus has Superantigen (SAg) activity. It can be used as part of a
CC   method is specifically used to diagnose type 1 diabetes mellitus.
CC   Modified proteins expressed by the retroviral sequence (without SAg
CC   activity but still able to induce an immune response) are useful in
CC   vaccines to treat or prevent SAg-related autoimmune disease; nucleic acid
CC   sequences encoding (modified) SAg can be used similarly to treat such
CC   diseases. Retroviral-encoded SAg are important in pathogenesis of
CC   autoimmune disease, probably by activating autoreactive T cells. The
CC   method is very specific (it can differentiate between expressed and non-
CC   expressed viral nucleic acids) and can be used even where the pathogen is
CC   an ubiquitous endogenous retrovirus. Blood or plasma samples can be
CC   tested without extensive preparation and diagnosis can be made before
CC   clinical signs are apparent, allowing early intervention before severe
CC   tissue damage has occurred

XX
PT   New isolated human endogenous retrovirus - used to develop products for
PT   the diagnosis, prevention and treatment of autoimmune disease,
PT   particularly insulin dependent diabetes mellitus.
XX
PS   Claim 8; Page 90; 165pp; English.
XX
CC   This oligonucleotide is specific to the polyA signal present in the 3' R-
CC   poly(A) sequences at the 3' extremity of IDDMK1.2-22, a newly identified
CC   human endogenous retrovirus (HERV) that is the source of superantigen
CC   (SAg) activity in insulin-dependent diabetes mellitus (IDDM) patients. It
CC   can be used as a probe or primer (claimed) in a method for the diagnosis
CC   of a human autoimmune disease. IDDMK1.2-22 is ubiquitous in the human
CC   genome but is only expressed in diabetic individuals. The invention
CC   provides IDDMK1.2-22 nucleic acids (see AAX07186-91) and encoded
CC   polypeptides (see AAW97745-48). These can be used in methods for the
CC   diagnosis, treatment and prevention of IDDM

PT   Novel promoter used to produce transgenic plants with higher expression
PT   of a desired gene.
XX
PS   Example 1; Page 14; 24pp; English.
XX
CC   The present sequence is a PCR primer used to synthesise carrot CR16.1
CC   fragment. This fragment along with a 10 bp synthetic DNA is used in the
CC   construction of a plant promoter. The promoter is used for controlling
CC   the expression of a desired gene e.g. soybean glycinin, stearoyl-ACP-
CC   desaturase and S-locus type specific RNase gene (male sterility-related
CC   gene) in a host cell especially a microorganism or a plant cell. The
CC   transformed plant cells can be used to produce transgenic plants. The
CC   promoter is compact and therefore suitable for higher expression of a
CC   desired gene in a particular tissue compared to other host tissues

PT   New array of nucleic acid probes, useful for in situ hybridization, in
PT   Southern, Northern or dot-blot hybridization to identify or detect the
PT   sequence or specific mutations of any gene.
XX
PS   Claim 1; SEQ ID NO 99036; 9pp; English.
XX
CC   The invention discloses a microarray comprising a plurality of nucleic
CC   acid probes including one of 2,018,500 fully defined sequences, or its
CC   perfect match, perfect mismatch, antisense match or antisense mismatch.
CC   Also disclosed is a method of gene expression analysis. The array is used
CC   in monitoring gene expression levels by hybridisation to a DNA library,
CC   in analysis of genetic variation or in hybridisation of tag-labelled
CC   compounds. The nucleic acid probes are specifically designed for analysis
CC   of at least one target sequence. The method of analysis comprises
CC   hybridising at least one or more nucleic acids to at least two or more
CC   nucleic acid probes and detecting the hybridisation. The nucleic acid
CC   probes are attached to a solid support. The analysis comprises monitoring
CC   gene expression levels, identifying biallelic markers or polymorphisms,
CC   or family members of a gene and a cross-species comparison. Each of the
CC   nucleic acids further comprises a tag sequence. The array of nucleic acid
CC   probes is useful in in situ hybridisation, in Southern, Northern or dot-
CC   blot hybridisation to identify or detect the sequence or specific
CC   mutations of any gene, in mapping the 5' termini of mRNA molecules by
CC   primer extensions or in screening cDNA or genomic libraries or subclones
CC   for additional subclones containing segments of DNA that have been
CC   isolated and previously sequenced. The sequence presented is one of the
CC   nucleic acid probes incorporated in the microarray. Note: The sequence
CC   data for this patent can also be obtained in electronic format directly
CC   from USPTO at seqdata.uspto.goc/sequence.html

PT   Isolated genes (Gene 216) from human chromosome 20p13-p12 and the
PT   proteins they encode, useful for the prevention, diagnosis and treatment
PT   of asthma, obesity and inflammatory bowel disease.
XX
PS   Example 10; Page 150; 520pp; English.
XX
CC   The invention relates to isolated genes (Gene 216) from human chromosome
CC   20p13-p12 and the proteins they encode. The nucleic acids and proteins
CC   may be used in the prevention, diagnosis and treatment of diseases
CC   associated with inappropriate Gene 216 expression. For example, the
CC   nucleic acids (or vectors) and proteins may be used to treat disorders
CC   associated with decreased expression by rectifying mutations or deletions
CC   in a patient's genome that affect the activity of gene 216 by expressing
CC   inactive proteins or to supplement the patients own production of Gene
CC   216 proteins. Additionally, the nucleic acids may be used to produce the
CC   secreted Gene 216 protein, by inserting the nucleic acids into a host
CC   cell and culturing the cell to express the protein. The nucleic acids and
CC   complementary sequences may also be used as DNA probes in diagnostic
CC   assays to detect and quantitate the presence of similar nucleic acid
CC   sequences in samples and therefore which patients may be in need of
CC   restorative therapy. The Gene 216 protein may also be used as antigens in
CC   the production of antibodies against Gene 216 and in assays to identify
CC   modulators of Gene 216 expression and activity. The anti-Gene 216
CC   antibodies and antagonists may also be used to down regulate expression
CC   and activity. The anti-Gene 216 antibodies may also be used as diagnostic
CC   agents for detecting the presence of Gene 216 proteins in samples (e.g.
CC   by enzyme linked immunosorbant assay or ELISA). Disorders that may be
CC   prevented, diagnosed and/or treated by the above methods include, for
CC   example asthma, obesity and inflammatory bowel disease. The present
CC   sequence is that of a Gene 216 related primer used in examples of the
CC   invention. The primers are used in the physical mapping of the gene
CC   (ABZ72067-ABZ72088), polymorphism identifiction using single strand
CC   conformational polymorphism (SSCP) analysis (ABZ72091-ABZ72184),
CC   sequencing (ABZ72185-ABZ72268) and genotyping (ABZ72317-ABZ72362)

PT   New isolated gene 216 nucleic acids, useful for diagnosing, preventing or
PT   treating a disorder, such as asthma, bronchial hyper-responsiveness,
PT   chronic obstructive pulmonary disease, obesity or inflammatory bowel
PT   syndrome.
XX
PS   Example 10; Page 156; 650pp; English.
XX
CC   This invention relates to a novel isolated nucleic acid, gene 216,
CC   identified from human chromosome 20p13-p12. The invention also discloses
CC   regions of the 216 gene that contain single nucleotide polymorphisms
CC   (SNP's) which may be used as markers for disease susceptibility or
CC   severity. The nucleotides of the invention may have antiasthmatic,
CC   antiinflammatory or anorectic activities and may be used in gene therapy.
CC   The nucleic acids, antibodies or its fragments are useful for diagnosing,
CC   preventing or treating a disorder, such as respiratory diseases (e.g.
CC   asthma, bronchial hyper-responsiveness, chronic obstructive pulmonary
CC   disease or adult respiratory distress syndrome), obesity, or inflammatory
CC   bowel syndrome. The nucleic acids are also useful for identifying
CC   increased susceptibility of a subject to the disorders mentioned. The
CC   nucleic acids can also be used as primers and templates for the
CC   recombinant production of disorder-associated peptides or polypeptides,
CC   for chromosome and gene mapping, or for tissue distribution studies. The
CC   present sequence represents a gene 216 specific PCR primer used in the
CC   scope of the invention

PT   Gene 216 nucleic acid, useful for preparing a composition for treating
PT   disorders e.g., asthma, bronchial hyperresponsiveness, atopy, chronic
PT   obstructive lung disease and adult respiratory distress syndrome.
XX
PS   Example 10; SEQ ID NO 162; 441pp; English.
XX
CC   The invention describes a new isolated nucleic acid comprising a fully
CC   defined sequence having 23574 bp or at least its 50 or 15 contiguous
CC   nucleotides and includes: allele G of single nucleotide polymorphism
CC   (SNP) AB+2; allele G of SNP BC+1; and allele C of SNP BC+2. The invention
CC   describes identifying increased susceptibility to a disorder comprising
CC   asthma, bronchial hyperresponsiveness, atopy, chronic obstructive lung
CC   disease and adult respiratory distress syndrome in a subject comprising
CC   testing a biological sample obtained from a subject for the presence of
CC   at least one allele or haplotype given in the specification, where the
CC   presence identifies an increased susceptibility to the disorder. The
CC   nucleic acid is useful for preparing a composition for treating disorders
CC   comprising asthma, bronchial hyperresponsiveness, atopy, chronic
CC   obstructive lung disease and adult respiratory distress syndrome. This
CC   sequence represents a primer used to detect single nucleotide
CC   polymorphisms in the human gene 216.

XX
PT   Identifying a candidate polymorphic repeat within a coding sequence, for
PT   understanding or treating genetic disease, comprises detecting tandem
PT   repeats in a target coding sequence and scoring the repeats for
PT   polymorphic probability.
XX
PS   Example; Col 273; 588pp; English.
XX
CC   The invention discloses a method for identifying a candidate polymorphic
CC   repeat within a coding sequence (expressed sequence tag, EST), which
CC   comprises detecting tandem repeats in a target coding sequence, scoring
CC   the repeats for polymorphic probability and generating a dataset
CC   correlating the repeats with polymorphic probability to identify a
CC   candidate polymorphic repeat. The computational methods (polymorphic
CC   marker prediction of ubiquitous simple sequences, POMPOUS, and Rep-X) are
CC   useful for identifying and detecting candidate polymorphic repeats in
CC   human genes, which can be used to understand, treat or eliminate genetic
CC   diseases, predispositions or adverse drug-treatment reactions. Examples
CC   of diseases linked to nucleotide repeats are Machado-Joseph, Haw River
CC   syndrome, Huntington's disease, fragile-X syndrome, Fredreich's ataxis,
CC   myotonic dystrophy, hyperandrogenaemia, spinal and bulbar atrophy and
CC   spinocerebellar ataxia. The sequences presented in ABX79676-ABX80022 are
CC   the polymorphic repeats identified for a search of human ESTs

PT the presence of or risk of developing type 1 diabetes or a related
PT disorder in human subjects.
XX
PS Example 2; SEQ ID NO 30; 87pp; English.
XX
CC The present invention describes a GAD65 polypeptide comprising an E517P
CC mutation. The polypeptide is characterised by decreased specific binding
CC to an antibody selected from GAD6, MICA-1, MICA-3, MICA-4 and MICA-6,
CC where the decreased binding is relative to a corresponding GAD65
CC polypeptide not having the E517P mutation. Also described: (1) methods
CC for detecting the presence of or risk of type 1 diabetes in a subject;
CC (2) an isolated nucleic acid selected from: (a) nucleic acids which
CC encode the rat Ian5(+) polypeptide; (b) nucleic acids which encode the
CC rat Ian5(lyp) polypeptide; or (c) full length complements of the nucleic
CC acids of (a) or (b); (3) an antibody that: (a) specifically binds to rat
CC Ian5(+) polypeptide, where the antibody is not immunologically cross-
CC reactive with human Ian5 or mouse Ian5 polypeptide; or (b) specifically
CC binds to rat Ian5(lyp) polypeptide, where the antibody is not
CC immunologically cross-reactive with rat Ian5(+), human Ian5 or mouse Ian5
CC polypeptide; (4) an expression construct comprising the following
CC elements linked in operable combination: a transcriptional promoter, a
CC nucleic acid described above, and a transcriptional terminator; (5) a
CC prokaryotic or eukaryotic cell transformed or transfected with the
CC expression construct described above; (6) a vector comprising the
CC expression construct described above; (7) an isolated host cell
CC comprising the vector; (8) a method for producing an Ian5 polypeptide;
CC (9) an in vitro method of identifying agonists or antagonists of an Ian5

```
CC   pathway to identify candidates for type 1 diabetes drug development; (10)
CC   methods for developing gene therapy for type 1 diabetes; and (11) a
CC   method for identifying a genetic mutation that correlates with type 1
CC   diabetes. GAD65 has antidiabetic activity, and can be used in gene
CC   therapy. The composition and methods of the present invention are useful
CC   in diagnosing, preventing or treating diabetes. The methods may also be
CC   used in screening for agonists or antagonists of Ian5 pathways to
CC   identify candidate agents for diabetes drug development, or in developing
CC   gene therapy for type 1 diabetes or a related disorder. The present
CC   sequence is used in the exemplification of the present invention.

PT   Measuring telomere length - by forming primer extension prods.
PT   complementary to telomere, or by hybridisation with complementary
PT   labelled probe.
XX
PS   Disclosure; Page 19; 64pp; English.
XX
CC   A method for measuring telomere length has been produced which involves:
CC   (a) covalently attaching an oligonucleotide linker to a telomere; (b)
CC   contacting a primer comprising a sequence sufficiently complementary to
CC   the linker to hybridise specifically under conditions so that the primer
CC   extends to form a primer extension product complementary to the telomere;
CC   and (c) correlating telomere length with primer extension product size,
CC   to provide a measure of telomere length. The present sequence represents
CC   a subtelomeric primer XpJCTN used in this invention. As telomere length
CC   serves as a biomarker for cell turnover, determination of telomere length
CC   can be used to diagnose and stage diseases and conditions such as
CC   tumours, alpha-thalassaemia, liver cirrhosis, muscular dystrophy,
CC   osteoarthritis, Hutchison-Gifford progeria, Down's syndrome,
CC   atherosclerosis, cardiovascular disease, HIV infection and fertility
CC   problems. The methods can also be used to monitor the effectiveness of
CC   various therapeutics in expanding, and/or reducing the proliferative
CC   lifespan of cells. The methods are conducive to high throughput or
CC   automated processes, provide for intracellular and intracellular telomere
CC   length determination and comparison and for the separation of cells or
CC   chromosomes based on telomere length

PT   Determining telomere length by hybridisation of chromosomal DNA with
PT   labelled probe - useful for assessing age and proliferative status of
PT   cells, e.g. for diagnosis and prognosis of cancer and in cell senescence.
XX
PS   Disclosure; Col 11; 23pp; English.
XX
CC   AAV62112-V62122 are primers used in a novel method to determine telomere
CC   length. The method involves treating denatured chromosomal DNA, that has
CC   not been fractionated by gel electrophoresis, with a labelled probe
CC   complementary to a telomere repeat sequence. The amount of bound probe
CC   can be correlated with the telomere length, by comparison with results
CC   for a control of known length. Telomere length is a marker of cell
CC   turnover, e.g. the relative age or proliferative capacity, and its
CC   measurement is used in diagnosis, staging and prognosis of cancer, cell
CC   senescence or other diseases (e.g. liver cirrhosis, muscular dystrophy,
CC   osteoporosis, wound healing and fertility problems). Telomere length can
CC   also be used to monitor treatment with compounds that modulate telomere
CC   length, e.g. in cancer chemotherapy. The method can also be used to
CC   identify modulators of telomere length, telomerase activity or the rate
CC   of telomere loss, and to detect telomerase activity. The method is quick,
CC   with better sensitivity, efficiency, reliability and accuracy than known
CC   methods and does not require gels. The method is suitable for automation
CC   and can be applied to single chromosomes (for comparing interchromosome
CC   variations). The method allows separation of cells and/or chromosomes
CC   according to telomere length

PT   New isolated nucleic acid, useful for treating viral diseases associated
PT   with tumors and cell degeneration, also related polypeptides, antibodies
PT   and transfected cells.
XX
PS   Disclosure; Page 95; 720pp; French.
XX
CC   The invention relates to a novel isolated 17 mer nucleic acid sequence,
CC   given in the specification, a sequence containing at least 15 consecutive
CC   nucleotides from the 17 mer sequence, a sequence with, after optimal
CC   alignment, at least 80 % identity to the 17 mer sequence, a sequence that
CC   hybridizes to them under highly stringent conditions, or the complement
CC   of any of them, or the corresponding RNA. The novel isolated nucleic
CC   acids of the invention are useful as probes and primers for detecting,
CC   identifying, quantifying and/or amplifying a nucleic acid, e.g. as one
CC   component of a gene chip, in vitro as (anti)sense reagents, and for
CC   production of recombinant polypeptides. Any of the nucleic acids,
CC   polypeptides, vectors containing the nucleic acids, cells containing the
CC   vector or antibodies directed against the polypeptides are useful for
CC   preparation of pharmaceuticals for prevention and/or treatment of viral
CC   diseases that are characterised by development of tumours or cell
CC   degeneration, specifically cancer but also Alzheimer's disease and
CC   schizophrenia. Analysis of the expression of the 17 mer nucleic acids in
CC   patient samples is useful for diagnosis and/or prognosis of these
CC   diseases. The polypeptides can also be used to generate antibodies, and
CC   both the polypeptide and antibodies are useful as components of protein
CC   chips. The nucleic acid sequences of the invention can be used in gene
CC   therapy. This polynucleotide sequence represents a tumour suppression
CC   related human fukutin oligonucleotide of the invention

PT   New variants of calcium/calmodulin-dependent protein kinase-like nucleic
PT   acids and polypeptides, useful for diagnosing and treating
PT   neuropsychiatric disorders, e.g. schizophrenia, schizoaffective disorder,
PT   and bipolar disorder.
XX
PS   Claim 17; Page 98; 223pp; English.
XX
CC   The invention relates to a nucleic acid comprising a polymorphic region
CC   of a Calcium/Calmodulin-dependent protein kinase-like gene (CADPKL)
CC   allelic variant, and the polypeptide it encodes. CADPKL allelic variants
CC   are useful in determining whether a subject has or is at risk of
CC   developing a neuropsychiatric disorder, such as schizophrenia, attention
CC   deficit disorder (ADD), schizoaffective disorder, bipolar disorder,
CC   unipolar affective disorder and adolescent conduct disorder. The
CC   polypeptides, polynucleotides, antibodies and modulators of the CADPKL
CC   allelic variants are useful for diagnosing or treating these
CC   neuropsychiatric disorders. The polypeptides may be used to raise
CC   antibodies to a CADPKL polypeptide. The nucleic acids may be used as
CC   probes or primers, in pharmacogenomics for designing therapies for the
CC   disorders, and in fingerprinting for detection of different individuals
CC   with the same species (e.g. paternity testing). This sequence represents
CC   a PCR primer used to amplify human CADPKL DNA of the invention

CC This invention relates to 59 human secreted proteins and the nucleotide
CC sequences encoding them. Sequences AAC59788-C59846 and AAB34687-B34745
CC represent the proteins and their encoding nucleotide sequences, and
CC sequences AAB34746-B34771 represent fragments of the proteins. Probes for
CC the DNA sequences are represented by sequences AAC59847-C59596. The
CC proteins exhibit neuroprotective, dermatological, immunosuppressive,
CC antiinflammatory, antianaemic, nootropic, antiparkinsonian,
CC cerebroprotective, haemostatic, vulnerary, cytostatic, antipsoriatic,
CC antibacterial, virucide, and fungicide activity. The proteins and
CC nucleotide sequences are useful as nutritional sources or supplements and
CC in research. The proteins are useful for treating immune deficiency and
CC disorders, which may be genetic or resulting from infections, autoimmune
CC disorders such as multiple sclerosis, systemic lupus erythmatosus,
CC rheumatoid arthritis, and for treating myeloid or lymphoid cell
CC deficiencies such as anaemias by regulating haematopoiesis. The proteins
CC are also useful in compositions for bone, cartilage, tendon, ligament
CC and/or nerve tissue growth or regeneration, for wound healing, tissue
CC repair and replacement and in the treatment of wounds, incisions and
CC ulcers. Other uses include in the treatment of central and peripheral
CC nervous system and neuropathies such as Alzheimer's and Parkinson's
CC diseases and Shy-Drager syndrome, and mechanical and traumatic disorders,
CC such as spinal cord disorders, head trauma and stroke. The proteins may
CC also be used as a contraceptive, and for treating coagulation disorders
CC such as haemophilias. The protein and nucleotide sequences with cadherin
CC activity are useful for treating cancer. Other uses for the protein
CC include for inhibiting the growth, infection or function of, or killing,
CC infectious agents such as bacteria, virus, fungi and other parasites, for
CC effecting bodily characteristics such as height, weight, hair colour,
CC effecting biorhythms or cardiac cycles or rhythms, effecting metabolism,
CC catabolism, anabolism, processing, utilization, storage or elimination of
CC dietary fat, lipid, protein, carbohydrate, vitamins, minerals, cofactors,
CC effecting behavioural characteristics, providing analgesic effects and
CC for treating hyperproliferative disorders such as psoriasis

PT   New non-steroidal anti-inflammatory drug activated gene with anti-
PT   tumorigenic properties, useful in drug screening, particularly for
PT   identifying and characterizing agents or compounds having anti-cancer
PT   properties.
XX
PS   Example 1; Page 34; 67pp; English.
XX
CC   The present invention describes an isolated and purified non-steroidal
CC   anti-inflammatory drug activated gene (NSAID associated gene, also
CC   designated NAG-1), which comprises a 8902 base pair sequence (I). (I) has
CC   cytostatic activity. (I) is useful in drug screening, particularly for
CC   identifying and characterising agents that are agonistic or antagonistic
CC   to the activation of the promoter region of the NAG-1 gene, the
CC   activation of which is correlated with the apoptotic elimination of
CC   certain cancers. In particular, the DNA is useful for identifying
CC   compounds having anti-cancer properties. NAG-1 peptides encoded by (I)
CC   are useful for treating cancer. The NAG-1 gene given in the present
CC   invention, having Genbank accession number AF019770, is designated as
CC   human macrophage inhibitory cytokine-1 (MIC-1). The present sequence
CC   represents a PCR primer for a human NSAID regulated gene designated
CC   INDO29, which is used in an example from the present invention

PT   Kit for automated genotyping contg. pairs of PCR primers - designed to
PT   amplify polymorphic nucleotide repeat sequences, arranged in sets each
PT   with a characteristic fluorescence label, useful e.g. in detection of
PT   disease related genetic rearrangement.
XX
PS   Claim 4; Fig 7B-2; 104pp; English.
XX
CC   The method aims to provide a collection of highly reproducible
CC   microsatellite marker sequences (MMS) at approx. 10-50 cM intervals
CC   throughout the human genome which can be detectably labelled. The MSS are
CC   polymorphic, simple sequence repeats and can be used in automated
CC   genotyping, esp. fluorescence-based. The primers correspond to the unique
CC   DNA sequence surrounding each marker, and PCR is used to detect each
CC   polymorphism. When the MSS show considerable polypmorphism (ie. a
CC   difference in the number of repeats) between individuals, the markers can
CC   be particularly informative. The MSS can be ideal for linkage studies.
CC   Kits comprise at least 4 groups, of at least 3 sets, each comprising
CC   labelled primers for PCR amplification of the DNA. Group 2 primer pairs
CC   are shown in AAQ95369-416. The published size range of the IL-9 allele is
CC   271-283 bp, and the degree of heterozygosity in the population is about
CC   63%

XX
CC   PCR primers AAZ01426-Z06209 were used to amplify open reading frames
CC   (ORFs) of the genome of Chlamydia trachomatis (see AAZ01425). These ORFs
CC   encode polypeptides (see AAY36754-Y37949) which can be used as vaccines
CC   against Chlamydia trachomatis. Antisense and ribozyme sequences can also
CC   be used to control growth of the microorganism. Chlamydia trachomatis is
CC   responsible for a large number of diseases, e.g. eye diseases such as
CC   conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion
CC   conjunctivitis; genital diseases such as nongonococcal uretritis,
CC   epidymitis, cervicitis, salpingitis, perihepatitis, bartholinitis;
CC   pneumopathy in breast feeding infants; and venereal lymphogranulomatosis.
CC   The polypeptides of the invention may be of use in treating these
CC   diseases

PT   New polynucleotide encoding a cytochrome P450 (CYP) 3AX polypeptide,
PT   useful for diagnosing or treating disorders related to the expression of
PT   a molecular variant CYP3AX gene, e.g. cancer.
XX
PS   Example 3; Page 18; 52pp; English.
XX
CC   The invention relates to a polynucleotide which encodes a cytochrome P450
CC   (CYP) 3AX polypeptide. The polynucleotide is useful in diagnosing or
CC   treating a disorder related to the expression of a molecular variant
CC   CYP3AX gene in a subject, such as cancer. It may also be used for
CC   identifying and obtaining drug candidates and inhibitors for therapy of
CC   disorders related to the malfunction of CYP3AX encoding genes. The
CC   present sequence represents a CYP3AX PCR primer of the invention

PT   New antisense oligonucleotides for modulating human farnesoid X receptor
PT   (FXR) expression, useful for treating conditions associated with FXR in
PT   humans, e.g. cardiovascular disease, atherosclerosis or
PT   hypercholesterolemia.
XX
PS   Claim 3; Page 75; 127pp; English.
XX
CC   The invention relates to antisense compounds, compositions and methods
CC   for modulating the expression of human farnesoid X receptor (FXR). FXR is
CC   also known as NR1H4, retinoid X receptor-interacting protein 14 (RIP14)
CC   and bile acid receptor (BAR). The antisense oligonucleotide is useful for
CC   inhibiting the expression of human FXR in cells or tissues. It is
CC   particularly useful for treating or preventing a disease or condition
CC   associated with FXR in a human, e.g. cardiovascular disease,
CC   atherosclerosis or hypercholesterolaemia. The antisense compound is
CC   useful for diagnostics, therapeutics, prophylaxis, or as research
CC   reagents or kits. It is also used in gene therapy. The present sequence
CC   is an antisense oligonucleotide targetted to human FXR DNA. This sequence
CC   is used to illustrate the method of the invention

PT   Pharmaceutical composition for treating ailments associated with impaired
PT   respiration, has oligo(s) antisense to specific gene(s) or its
PT   corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
PT   ubiquinone.
XX
PS   Claim 15; SEQ ID NO 558; 872pp; English.
XX
CC   The invention relates to a novel pharmaceutical composition, which has a
CC   first active agent comprising an oligonucleotide antisense to the
CC   initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC   5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC   junctions of genes encoding a polypeptide associated with lung and/or
CC   nasal airway dysfunction and a second active agent comprising an
CC   antiinflammatory steroid and ubiquinone. A composition of the invention
CC   has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC   immunosuppressive, and cytostatic activity. The composition may have a
CC   use in antisense gene therapy. The composition is useful for treating or
CC   preventing a respiratory, lung or malignant disease or condition, also
CC   for enhancing the prophylactic or therapeutic respiratory effect of an
CC   antiinflammatory steroid in a subject, for reducing or depleting levels
CC   of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC   receptor, producing bronchodilation, increasing levels of ubiquinone or
CC   lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC   lung inflammation, lung allergies, or a respiratory disease or condition.
CC   Note: The sequence data for this patent is not represented in the printed
CC   specification, but was obtained in electronic format directly from WIPO
CC   at ftp.wipo.int/pub/published_pct_sequences

PT   Pharmaceutical composition for treating asthma, has antisense
PT   oligonucleotide containing less percentage of adenosine, targeted to
PT   nucleic acids associated with lung airway or lung dysfunction, and
PT   bronchodilating agent.
XX
PS   Claim 15; SEQ ID NO 558; 763pp; English.
XX
CC   This invention describes a novel composition (a) a first active agent,
CC   comprising oligonucleotides, effective for alleviating
CC   bronchoconstriction, respiratory tract inflammation, allergies and
CC   reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,
CC   surfactant depletion or hyposecretion, when administered to a mammal. The
CC   oligonucleotides are derived from a gene encoding or regulating
CC   expression of a target polypeptide associated with lung airway or lung
CC   dysfunction or cancer and can be anti-sense to the corresponding mRNA.
CC   The invention also describes a kit, that comprises: (a) a delivery
CC   device, in separate containers, (b) the oligonucleotides, (c)
CC   instructions for adding a carrier and for use of the kit. The composition
CC   of the invention has antiallergic, antiinflammatory, antiasthmatic,
CC   analgesic, hypotensive, immunosuppressive and cytostatic activity, is a
CC   beta-adrenergic agonist. The composition is useful for preventing or
CC   treating a respiratory, lung or malignant disease. The administered
CC   composition comprises oligo and is administered to reduce the production
CC   or availability, or to increase the degradation of the target mRNA or to
CC   reduce the amount of target polypeptide present in the lungs. The
CC   pulmonary obstruction, and/or bronchoconstriction and/or lung
CC   inflammation, allergies and/or surfactant hypoproduction are associated
CC   with a disease or condition such as pulmonary vasoconstriction,
CC   inflammation, allergies, asthma, impeded respiration, respiratory
CC   distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary
CC   hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary
CC   transplantation rejection, pulmonary infections, bronchitis or cancer.
CC   The reduced adenosine content of the anti-sense oligos corresponding to
CC   thymidines present in the target RNA serves to prevent the breakdown of
CC   the oligonucleotides into products that free adenosine into the system
CC   e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to
CC   prevent any unwanted effects due to it

PT   New antisense oligonucleotides targeted to a nucleic acid encoding liver
PT   related homologue-1 (LRH1), useful for treating breast cancer,
PT   dyslipidemia, atherosclerosis, hypercholesterolemia, or hepatitis.
XX
PS   Example 15; SEQ ID NO 2077; 909pp; English.
XX
CC   This invention relates to novel antisense compounds useful for modulating
CC   the expression of liver related homologue-1 (LRH1) and splice variants
CC   thereof. Specifically, it refers to compositions 8-30 nucleobases in
CC   length that target a portion of an active site on the nucleic acid
CC   molecule encoding LRH1 (also known as NR5A2). LRH1 is a monomeric orphan
CC   nuclear receptor protein that functions as a tissue specific
CC   transcription factor. The present invention describes antisense
CC   oligonucleotides that comprise at least one modified internucleoside
CC   linkage, a phosphorothioate linkage; at least one modified sugar moiety,
CC   a 2'-O-methoxyethyl (2' MOE) and at least one modified nucleobase, a 5-
CC   methylcytidine. These antisense compounds are useful for treating or
CC   diagnosing a disease associated with LRH1, such as breast cancer,
CC   dyslipidaemia, atherosclerosis, low HDL (high density lipoprotein), high
CC   LDL (low density lipoprotein), hypercholesterolaemia, gall stones,
CC   triglyceridaemia, obesity, hepatitis B virus-mediated acute or chronic
CC   hepatitis, as well as hepatocellular carcinoma or a condition associated
CC   with aromatase activity. Accordingly, these compositions exhibit
CC   cytostatic, antilipaemic, antiarteriosclerotic, anorectic, hepatotropic,
CC   litholytic, antiinflammatory and virucidal activities. This
CC   oligonucleotide sequence is an antisense DNA oligo used to modulate the
CC   expression of the human LRH1 protein of the invention.

XX
CC   The present sequence represents a chimeric antisense oligonucleotide
CC   targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The
CC   human mPGES-1 gene is located on chromosome 9, more specifically to
CC   9q34.3. The present invention also describes: (1) antisense compounds,
CC   having a sequence comprising 8-30 bp targeted to a nucleic acid encoding
CC   mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and
CC   inhibits its expression; (2) a method of inhibiting the expression of
CC   mPGES-1 in cells or tissues; and (3) a method of treating an animal
CC   having a disease or condition associated with mPGES-1. MPGES-1 chimeric
CC   antisense oligonucleotides and antisense compounds have cytostatic,
CC   antidiabetic, immunomodulator, cardiant, neuroprotective,
CC   antiinflammatory, neuroprotective, nootropic, antiarthritic, vasotropic,
CC   ophthalmological, immunomodulatory and cardiovascular activities, and can
CC   be used as mPGES-1 inhibitors and in gene therapy. The antisense compound
CC   can be used for preparing a composition for treating a disease or
CC   condition associated with mPGES-1 e.g., inflammation, Alzheimer's
CC   disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or
CC   ophthalmic, immunological, cardiovascular or neurological disorder.

PT New nucleic acid containing polymorphisms in the cyclooxygenase-2 gene,
PT for gene therapy of inflammation and for establishing a genotype or
PT haplotype.
XX
PS Example 1b; Page 40; 118pp; English.
XX
CC This invention relates to a polynucleotide sequence that is a polymorphic
CC variant of the human prostaglandin-endoperoxide synthase 2 (PTGS2) gene
CC also referred to as cyclooxygenase 2. The human PTGS2 gene sequence
CC AAF80896 contains 27 single nucleotide polymorphisms (SNPs). AAF80896 and
CC AAF80897 represent human PTGS2 gene and coding sequence, and the PTGS2
CC protein is represented by AAB72199. The invention includes PCR and
CC sequencing primers, and probes represented in AAF80898 - AAF81151 which
CC are used to isolated and characterise the PTGS2 gene sequence, and to
CC locate the positions of the SNPs. PTGS2 proteins and polynucleotide
CC sequences are used to express variant PTGS2 proteins, for structural
CC analysis or drug-binding studies and also in gene therapy (either
CC expressing PTGS2 or inhibitory RNA). Antibodies raised against PTGS2 are
CC useful for diagnosis, prognosis and therapy and analysis of the new, and
CC known, polymorphisms and used to determine PTGS2 haplotype and genotype,
CC especially for determining association between a particular trait, e.g. a
CC clinical response to drugs that target PTGS2 but also disease
CC susceptibility, severity or stage. Anti-PTGS2 antibodies are particularly
CC used for developing diagnostic tests and treatments for immune-related
CC disorders such as arthritis and inflammation. The polymorphisms may also
CC be used to study expression and biological function of PTGS2. Transgenic
CC animals that express PTGS2 are used to study expression of PTGS2
CC isogenes, for in vivo drug screening and testing, and for assessing
CC effects of therapeutic agents

PT Arraying genome clones.
XX
PS Claim 4; Page 43; 528pp; Japanese.
XX
CC The present invention describes a method of arraying genome clones. The
CC method comprises: (a) clones of the genomic libraries contained in
CC multiwell plates numbered for discrimination are mixed in each of the
CC multiwell plates; (b) a primer designed based on the chromosome marker
CC sequence is added to the mixture to carry out an amplification reaction;
CC (c) a signal corresponding to the marker is detected from the resultant
CC amplified product to specify the discrimination Nos. of the multiwell
CC plates containing the clones having said marker sequence; (d) the order
CC of the markers is changed so that the same discrimination Nos. succeed to
CC the maximum in the specified discrimination Nos. to array the multiwell
CC plates; (e) the clones in the multiwell plates of the specified
CC discrimination Nos. are mixed respectively in each wells of longitudinal
CC and lateral directions; (f) the mixed clones are cultured and the
CC resultant cultures are amplified by using the above primer; (g) signals
CC are detected from the amplified products; (h) the clones in the multiwell
CC plates are specified from the detected result; and (i) the clones are
CC reconstituted as the positions on the chromosome and arrayed. The
CC microarray is useful for gene analysis. ABL42957 to ABL45322 represent
CC PCR primers for human chromosome 1p36-35 DNA, and ABL45323 to ABL45634
CC represent PCR primers for human chromosome 21q22.1, which are
CC specifically claimed for use in the present invention

PT New polypeptides, designated as NOVX, useful for diagnosing and treating
PT infections, neurological diseases, cancer, allergy, and bone,
PT immunological, skin, renal, brain, muscle and autoimmune disorders.
XX
PS Example 3; Page 659; 672pp; English.
XX
CC The invention relates to a novel isolated polypeptide, designated NOVX
CC (NOV1 - 33), consisting of a mature form of one of 61 sequences, given in
CC the specification, or its variant, where amino acid residue(s) in the
CC variant differ from the mature form, provided that the variant differs in
CC not more than 15 % of the amino acids from the sequence of the mature
CC form. The NOVX polypeptides, nucleic acids encoding the polypeptides, and
CC an antibody to the polypeptides, are useful for treating or preventing a
CC NOVX-associated disorder in humans and for treating a syndrome associated
CC with a human disease (NOVX-associated disorder). NOVX polypeptides and
CC the encoding nucleic acids, are useful for determining the presence of or
CC predisposition to a disease associated with altered levels of NOVX
CC polypeptide and polynucleotide, by measuring the level of polypeptide
CC expression or the amount of nucleic acid from a mammal and comparing it
CC with another mammal not having or not predisposed to the disease. NOVX
CC polypeptide is also useful for identifying an agent that binds to NOVX
CC and a cell expressing NOVX is useful for identifying an agent that
CC modulates the expression or activity of NOVX. The antibodies and a
CC polypeptide having 95 % sequence identity to NOVX polypeptide are useful
CC for treating a pathological state in a mammal. The antibodies are also
CC useful for determining the presence or amount of NOVX in a sample. NOVX
CC polypeptides, polynucleotides and antibodies specific for the
CC polypeptides are useful for treating or preventing disorders or syndromes
CC including trauma, viral, bacterial, fungal, protozoal, and parasitic
CC infections. They can also treat disorders such as e.g., Alzheimer's
CC disease or a stroke. The NOVX encoding nucleic acids are useful for
CC expressing the NOVX proteins, to detect NOVX mRNA, or a genetic lesion in
CC a NOVX gene and to modulate NOVX activity. NOVX sequences are also useful
CC for identifying a cell or tissue type in a biological sample, to amplify
CC DNA sequences from very small biological samples such as tissues e.g.
CC hair or skin or body fluids in forensic biology and as primers and probes
CC for use in identifying and/or cloning NOVX homologues in other cell
CC types. The NOVX proteins are useful as an immunogen to generate
CC antibodies which are useful for diagnostically monitoring protein levels
CC and modulating NOVX activity. Cells comprising NOVX nucleic acids are
CC useful for producing non-human transgenic animals which are useful for
CC studying the function and/or activity of NOVX protein and for identifying
CC and/or evaluating modulators of NOVX protein activity. The NOVX nucleic
CC acids can be used in gene therapy. This polynucleotide sequence
CC represents a NOVX PCR primer of the invention

PT New nucleic acid molecule encoding chimeric proteins with binding
PT specificity for a site on HIV envelope glycoprotein gp120 and a site on
PT gp120 protein or on the extracellular portion of human CD4, for
PT preventing or treating HIV infection.

```
XX
PS   Example 4; Page 29; 48pp; English.
XX
CC   The invention discloses a nucleic acid molecule encoding a functional
CC   chimeric protein with binding specificity for at least two different
CC   sites. At least one site is on the human immunodeficiency virus-1 (HIV-1)
CC   envelope glycoprotein (env), gp120, and the other site is either on the
CC   gp120 protein or on the extracellular portion of human CD4, the major
CC   cellular receptor for HIV. The chimeric protein essentially comprises a
CC   first binding region of a soluble extracellular portion of human CD4,
CC   consisting of the immunoglobulin (Ig) variable region-like membrane
CC   distal domains (V1 and V2) and a second binding region of a variable
CC   region of an antibody heavy chain (VH), encoded by the VH3 gene, which is
CC   capable of being attached to an adjacent and non-overlapping site on the
CC   gp120 protein, or to a site on the extracellular portion of human CD4,
CC   and is capable of increasing the capacity of the extracellular portion of
CC   human CD4 to interact with gp120 and to block the interaction of HIV with
CC   membranal CD4. These two binding regions are physically connected by a
CC   linker region. The chimeric protein of the invention is useful for gene
CC   therapy and for preventing and treating an HIV infection and for
CC   neutralising and inhibiting virus replication and infectivity in a
CC   subject, preferably a mammal. The sequence presented is the PCR primer,
CC   22164, which was used to amplify the human VH3 gene, used in the
CC   construction of the VH3-CD4 (V1 and V2) chimeric protein

PT   Designing primers for simultaneous amplification of target DNA fragments
PT   in a single multiplex polymerase chain reaction, for high throughput
PT   multiplex DNA sequence amplification, comprises aligning two primers.
XX
PS   Disclosure; Page 42; 120pp; English.
XX
CC   The invention relates to a method of designing primers for simultaneous
CC   amplification of target DNA fragments in a single multiplex polymerase
CC   chain reaction by aligning a first primer and a second primer. The method
CC   comprises: (a) aligning a first primer and a second primer; and (b)
CC   selecting the first primer where the first primer at its 3' end does not
CC   contain four or more bases that are perfectly matching to the 3' end
CC   sequence of the first primer or a second primer, the first primer at its
CC   3' end does not contain seven or more bases that are perfectly matching
CC   except one mismatch to the 3' end sequence of the first primer or the
CC   second primer, the first primer at its 3' end does not contain six or
CC   more bases that are perfectly matching to a sequence anywhere of the
CC   first primer or the second primer, and the first primer at its 3' end
CC   does not contain eleven or more bases that are perfectly matching except
CC   one mismatch to a sequence anywhere of the first primer or the second
CC   primer. The method is useful for designing primers for simultaneous
CC   amplification of target DNA fragments in a single multiplex polymerase
CC   chain reaction. It is also useful in the identification of multiple genes
CC   related to multifactorial diseases, the genome-scale detection of genetic
CC   alterations, the studies in pharmacogenetic reactions, the genotyping
CC   genetic polymorphisms in a large population, the gene expression
CC   profiling in various samples and high throughput genotyping technologies.
CC   This sequence corresponds to an example of a primer of the invention.

CC   The invention relates to a novel isolated nucleic acid encoding human
CC   KTOM1 (kidney tumour overexpressed membrane) protein. The protein of the
CC   invention has cytostatic activity. The nucleotide may have a use in gene
CC   therapy. The KTOM1 nucleic acids may be used to diagnose, treat or
CC   monitor a disease caused by altered expression of human KTOM1.
CC   Compositions comprising the nucleic acids, proteins or antibodies may be
CC   used to treat subjects having defects in KTOM1 which can manifest as
CC   cancer of the kidney, as well as a disorder of liver, bone marrow, brain,
CC   heart, lung, kidney, colon, skeletal muscle, testis, uterus and placenta
CC   function. The sequence represents a probe used in the invention to scan
CC   the nt 1-1001 portion of human KTOM1a (ABQ63232)

PT   New antisense oligonucleotides for modulating selenophosphate synthetase
PT   2 (SPS2) expression, useful for diagnosing, preventing or treating
PT   conditions associated with SPS2, e.g. rheumatoid arthritis, inflammation
PT   or tumors.
XX
PS   Claim 1; SEQ ID NO 76; 47pp; English.
XX
CC   The invention relates to antisense compounds, compositions and methods
CC   for modulating the expression of selenophosphate synthetase 2 (SPS2). The
CC   composition comprises antisense oligonucleotides targeted to SPS2 gene.
CC   The antisense oligonucleotide is useful for modulating the expression of
CC   SPS2 in cells or tissues to treat diseases associated with their
CC   expression, e.g. rheumatoid arthritis, infections, inflammation or
CC   tumours. It is also used for diagnostics, prophylaxis, or as research
CC   reagents or kits. The antisense oligonucleotide is useful in antisense
CC   therapy. The present sequence is an antisense oligonucleotide targeted to
CC   human SPS2 DNA. This sequence is used in the exemplification of the
CC   invention.

PT   Treating proliferative skin or eye diseases and scarring, using ribozymes
PT   that cleave RNA encoding cytokines involved in inflammation, matrix
PT   metalloproteinases, growth factors and cell-cycle dependent kinases.
XX
PS   Example 1; Page 22; 408pp; English.
XX
CC   The present invention describes a method for treating a proliferative
CC   skin or eye disease and scarring. The method involves administering a
CC   ribozyme (I) which cleaves RNA encoding a cytokine involved in
CC   inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle
CC   dependent kinase, growth factor or a reductase, or administering a
CC   nucleic acid molecule (II) comprising a promoter operably linked to a
CC   nucleic acid segment encoding (I). (I) can have antipsoriatic,
CC   dermatological, cytostatic, antiseborrheic, antidiabetic, antisickling,
CC   ophthalmological, vulnerary, keratolytic and virucide activities, and
CC   cleaves RNA encoding cytokine involved in inflammation. (I) can be used
CC   in gene therapy. (I) and (II) are useful for treating proliferative skin
CC   diseases such as psoriasis, atopic dermatitis, actinic keratosis,
CC   squamous or basal cell carcinoma and viral or seborrheic wart. They can
CC   also be used for treating proliferative eye diseases such as diabetic
CC   retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of
CC   prematurity and retinal detachment, and for treating and preventing
CC   scarring such as keloid, adhesion and hypertrophic or hypertrophic burn
CC   scar. AAH57577 to AAH62099 represent sequences used in the
CC   exemplification of the present invention

PT   New VMGLOM genes and polypeptides, useful in gene therapy or for
PT   preventing, treating or alleviating disorders with vascular component,
PT   e.g. varicosities, cardiopathies, cerebral disorders or cancer.
XX
PS   Disclosure; Page 72; 157pp; English.
XX
CC   The present invention relates to the isolation of novel human and mouse
CC   VMGLOM polypeptides (long form and short form), and the nucleic acid
CC   molecules encoding them. VMGLOMs (also referred to as glomulins) are a
CC   subtype of venous malformations (VMs) called glomangiomas. In humans,
CC   VMGLOM has been mapped to chromosome 1p21-22. VMGLOMs and the nucleic
CC   acids encoding for them are useful as a medicament or for incorporation
CC   into a diagnostic kit. Such medicaments are useful for preventing,
CC   treating or alleviating disorders with a vascular component, particularly
CC   where alteration of vascular smooth muscle cell phenotype is needed, e.g.
CC   varicosities, cardiopathies or cardiomyopathies, cerebral disorders and
CC   cancer. The nucleic acids are also useful in gene therapy. The present
CC   sequence for forward PCR primer is used to amplify exon 14 of the human
CC   VMGLOM gene in the methods of the present invention

PT   Purificn. of double stranded DNA by triple helix formation - comprises
PT   hybridising immobilised oligo-nucleotide to specific sequence in target
PT   DNA.
XX
PS   Claim 11; Page 22; 34pp; French.
XX
CC   Double-stranded (ds) DNA can be purified from complex mixtures of nucleic
CC   acids, proteins, endotoxins, nucleases, etc. by passing the mixture over
CC   a support to which an oligonucleotide is covalently attached; the
CC   oligonucleotide is able to form a triple helix by hybridisation with a
CC   specific sequence present in the dsDNA. The present sequence is a
CC   preferred oligonucleotide which can form a triple-helix with the
CC   homopurine target sequence in AAT32773. The target sequence may be
CC   present naturally, e.g. in a plasmid origin of replication, or can be
```

```
CC   introduced artificially. The method is particularly suited to
CC   purification of plasmid DNA

PT   Purification of double-stranded DNA to pharmaceutical purity - using
PT   ceramic hydroxy:apatite and affinity or ion-exchange chromatography,
PT   particularly for plasmids intended for gene therapy.
XX
PS   Disclosure; Page 6; 51pp; French.
XX
CC   This sequence represents an oligonucleotide used in a method of purifying
CC   double-stranded DNA to pharmaceutical purity, especially for use in gene
CC   or cellular therapy. The method comprises at least one stage of
CC   chromatography on a column of ceramic hydroxyapatite (HA), and another
CC   stage comprising an affinity chromatography purification, preferably with
CC   an immobilised oligonucleotide able to form a triple-helix structure.
CC   This sequence is an example of such a triple-helix forming oligomer. The
CC   oligonucleotide preferably binds to a sequence present in the plasmid to
CC   be purified, especially in a marker gene or the origin of replication

PT Purifying double-stranded (ds) DNA from a solution containing dsDNA and
PT other components, comprises passing the solution through a support
PT comprising a covalently coupled oligonucleotide able to form a triple
PT helix with the dsDNA.
XX
PS Disclosure; Page 5; 40pp; English.
XX
CC This invention comprises a method of purifying double-stranded DNA from a
CC solution containing the double-stranded DNA mixed with other components,
CC comprising passing the solution through a support comprising a covalently
CC coupled oligonucleotide capable of forming a triple helix with the double
CC -stranded DNA by hybridisation with a specific sequence present in the
CC double-stranded DNA. The method is useful for purifying double-stranded
CC DNA contained in a solution and mixed with other components. The new
CC method is a simple, rapid and effective method for DNA purification, and
CC makes it possible to obtain especially high purities with high yields.
CC The method enables DNA to be purified from complex mixtures comprising
CC other nucleic acids, proteins, endotoxins, nucleases and the like. The
CC supports may be readily recycled, and the DNAs obtained display improved
CC properties to pharmaceutical safety. Further, the method entails only one
CC step contrary to prior art. The present sequence represents an
CC oligonucleotide sequence used to create a triple helix in the DNA
CC purification method of the invention

PT   New isolated nucleic acid or alternate splice variant, useful for
PT   diagnosing and treating a disintegrin and metalloprotease (ADAM) or
PT   interactor gene-associated disorder, e.g. asthma, atopy, obesity or
PT   inflammatory bowel disease.
XX
PS   Claim 2; Page 125; 338pp; English.
XX
CC   The invention relates to an isolated nucleic acid or alternate splice
CC   variant comprising a nucleotide sequence containing at least one of the
CC   single nucleotide polymorphisms given in the specification, a nucleotide
CC   sequence having at least 15 contiguous nucleotides of them, or
CC   complements of them. The genes are ADAM19 (a disintegrin and
CC   metalloprotease 19, also known as gene 845), NRG2 (neuroregulin 2, also
CC   known as gene 847), endophilin 1 (also known as gene 874), endophilin 2
CC   (also known as gene 803) and ADAMTS2 (a disintegrin and metalloprotease
CC   with thrombospondin type1 motif 2, also known as gene 962). Also included
CC   are a vector comprising the isolated nucleic acid (or alternate splice
CC   variant), a host cell containing the vector, an isolated polypeptide
CC   encoded by the novel nucleic acid (or alternate splice variant), an
CC   antibody or antibody fragment that binds to the polypeptide,
CC   pharmaceutical compositions (comprising the nucleic acid or alternate
CC   splice variant, vector, polypeptide or antibody , and a carrier,
CC   excipient or diluent), a kit for detecting a disintegrin and
CC   metalloprotease (ADAM) gene nucleotide sequence (comprising the isolated
CC   nucleic acid or alternate splice variant, antibody or antibody fragment,
CC   and at least one component to detect the hybridisation of the variant or
CC   the binding of the antibody to an ADAM gene amino acid sequence), a kit
CC   for detecting an interactor gene amino acid sequence (comprising the
CC   antibody or antibody fragment, and at least one component to detect the
CC   binding of the antibody to the interactor gene amino acid sequence),
CC   diagnosing an ADAM or interactor gene-associated disorder or a
CC   respiratory disorder in a human subject, determining an ADAM or
CC   interactor gene pharmacogenetic profile in a human subject, identifying
CC   an orthologue of a human ADAM or interactor gene, treating an ADAM or
CC   interactor gene-associated disorder (or a respiratory disorder) by
CC   administering the pharmaceutical composition, a transgenic mouse (whose
CC   genome comprises an introduced null mutation in an endogenous gene that
CC   is orthologous to a human ADAM gene), making a homozygous transgenic
CC   knockout mouse, forming a crystal of the isolated polypeptide, a cell
CC   line comprising the isolated nucleic acid or alternate splice variant, a
CC   biochip comprising the isolated nucleic acid or alternate splice variant,
CC   an isolated nucleic acid probe or primer comprising at least 8 contiguous
CC   nucleotides of the nucleic acid, an isolated antisense nucleic acid,
CC   identifying an ADAM or interactor gene ligand and an isolated nucleic
CC   acid variant of Gene 803, 845, 847, 874 or 962. The nucleic acid or
CC   alternate splice variants, methods, kits and antibody/antibody fragment
CC   are useful for diagnosing and treating an ADAM or interactor gene-
CC   associated disorder, e.g. asthma, atopy, obesity or inflammatory bowel
CC   disease. The present sequence is an SSCP (single-strand conformation
CC   polymorphism) primer used to analyse the above genes for the presence of
CC   polymorphisms.

PT   Characterising genomic DNA by amplifying selected internal repeat units -
PT   in telomere repeat array used for, e.g. disease diagnosis, determn. of
PT   family relationships, telomere mapping, etc.
XX
PS   Claim 18; Page 52; 68pp; English.
XX
CC   The present sequence is a PCR primer for a sequence proximal to the human
CC   Xp/Yp pseudoautosomal region (PAR1) telomere repeat array, produced using
CC   sequence information obtd. from 32 Caucasian and 21 African DNAs. The
CC   sequence was found to contain 20 substitution polymorphisms, and a 10 bp
CC   deletion/insertion polymorphism found only in African DNAs. Claimed type
CC   specific primers, which hybridise to loci contained in the sequence, can
CC   be used for the characterisation of a genomic DNA test sample by
CC   amplifying selected internal repeat units in a telomere repeat array.
CC   This characterisation is useful in the detection of inherited or acquired
CC   disease predisposition, abnormal cell division or growth diagnosis (e.g.
CC   cancer), individual and family relationship identification and telomere
CC   mapping of human chromosomes from DNA flanking sequences

PT New isolated mammalian retinal calcium channel gene, used to develop
PT products for the diagnosis and treatment of incomplete congenital
PT stationary night blindness and related disorders.
XX
PS Example 4; Page 27; 55pp; English.
XX
CC The invention provides a DNA molecule comprising a sequence of
CC nucleotides encoding an alpha1F-subunit of a mammalian retinal calcium
CC channel (RCC), including a human alpha1F-subunit, a murine alpha1F-
CC subunit and orthologs of the human and murine alpha1F-subunits. The RCC
CC gene may be used to develop products for diagnostic tests, for incomplete
CC CSMB and risk assessment in affected families. The RCC gene can provide
CC information as to the basic defect in this retinal conditions, which
CC could lead to effective methods for treatment or cure of the disorder. As
CC the associated features of myopia, nystagmus and strabismus frequently
CC observed in patients with incomplete CSNB may be caused by calcium-
CC regulated development pathways, identification of the RCC gene may help
CC to elucidate the molecular details of eye development and which may lead
CC to treatment for related eye disorders or diseases. Sequences AAZ46522-
CC 540 represent PCR primers used for the isolation of murine CACNA1F
CC (alpha1F- subunit of RCC gene) ortholog

PT Human embryo-derived cell culture comprising cells that simultaneously
PT express polypeptide or mRNA markers that are characteristic of at least 2
PT cell types, useful in tissue transplantation, drug discovery, gene
PT therapy.
XX
PS Example 7; Page 75; 107pp; English.
XX
CC The specification describes a human embryo-derived (EBD) cell culture
CC that comprises cells which simultaneously express polypeptide or mRNA
CC markers that are characteristic of at least 2 different cell types. The
CC cell types are ectodermal, mesodermal, and/or endodermal cells. The
CC markers include nestin, vimentin, myf6, myosin light-chain 2 ventricular
CC isoform, flk1, alpha-1 fetoprotein and GATA-4. The EBD cells are useful
CC in cell culture, tissue transplantation, tissue engineering, drug
CC discovery and gene therapy. They are especially useful in transplantation
CC therapies for the treatment of Parkinson's disease, amyotrophic lateral
CC sclerosis, stroke, injury to motor neurons, including spinal cord injury,
CC and diabetes. Human EBD cells can be implanted into the central nervous
CC system for the treatment of disease or physical brain injury, such as
CC ischemia or chemical injury, as well as to treat diseases of cardiac,
CC skeletal or smooth muscles, liver, pancreas, eyes, vascular diseases, to
CC repopulate bone marrow, in organotypic co-culture, in the biosynthetic
CC production of macromolecules, and in the construction and testing of
CC human artificial chromosomes. AAH42612-85 represent PCR primers and
CC probes for markers of human cells. They were used to examine the mRNA
CC expression profiles of human cells

PT Determining telomere length of mammalian chromosomal DNA by annealing and
PT covalently binding telorettes, useful in assessing a potential anti-
PT cancer treatment and/or assessing, treating or diagnosing male
PT infertility.
XX
PS Claim 23; Page 36; 50pp; English.
XX
CC The present sequence represents a primer, which is used in the method of
CC the invention for determining telomere length. The method comprises
CC annealing the 3' end of a single-stranded oligonucleotide to a single-
CC stranded overhang comprising TTAGGG repeat sequences, and covalently
CC binding the oligonucleotide to the 5' end of the C-rich telomeric strand
CC forming a ligation product. This ligation product is amplified to form a
CC primer extension product, whose length is then detected. The method is
CC useful in assessing potential anti-cancer treatments and cancer-related
CC procedures. It can also be used in assessing telomere dynamics with age,
CC effect of modulating telomerase activity, and in assessing, treating or
CC diagnosing male infertility

PT   Pharmaceutical composition for treating asthma, has antisense
PT   oligonucleotide containing less percentage of adenosine, targeted to
PT   nucleic acids associated with lung airway or lung dysfunction, and
PT   bronchodilating agent.
XX
PS   Claim 15; SEQ ID NO 8846; 763pp; English.
XX
CC   This invention describes a novel composition (a) a first active agent,
CC   comprising oligonucleotides, effective for alleviating
CC   bronchoconstriction, respiratory tract inflammation, allergies and
CC   reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,
CC   surfactant depletion or hyposecretion, when administered to a mammal. The
CC   oligonucleotides are derived from a gene encoding or regulating
CC   expression of a target polypeptide associated with lung airway or lung
CC   dysfunction or cancer and can be anti-sense to the corresponding mRNA.
CC   The invention also describes a kit, that comprises: (a) a delivery
CC   device, in separate containers, (b) the oligonucleotides, (c)
CC   instructions for adding a carrier and for use of the kit. The composition
CC   of the invention has antiallergic, antiinflammatory, antiasthmatic,
CC   analgesic, hypotensive, immunosuppressive and cytostatic activity, is a
CC   beta-adrenergic agonist. The composition is useful for preventing or
CC   treating a respiratory, lung or malignant disease. The administered
CC   composition comprises oligo and is administered to reduce the production
CC   or availability, or to increase the degradation of the target mRNA or to
CC   reduce the amount of target polypeptide present in the lungs. The
CC   pulmonary obstruction, and/or bronchoconstriction and/or lung
CC   inflammation, allergies and/or surfactant hypoproduction are associated
CC   with a disease or condition such as pulmonary vasoconstriction,
CC   inflammation, allergies, asthma, impeded respiration, respiratory
CC   distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary
CC   hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary
CC   transplantation rejection, pulmonary infections, bronchitis or cancer.
CC   The reduced adenosine content of the anti-sense oligos corresponding to
CC   thymidines present in the target RNA serves to prevent the breakdown of
CC   the oligonucleotides into products that free adenosine into the system
CC   e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to
CC   prevent any unwanted effects due to it

PT   New antisense oligonucleotides targeted to a nucleic acid encoding liver
PT   related homologue-1 (LRH1), useful for treating breast cancer,
PT   dyslipidemia, atherosclerosis, hypercholesterolemia, or hepatitis.
XX
PS   Example 15; SEQ ID NO 2012; 909pp; English.
XX
CC   This invention relates to novel antisense compounds useful for modulating
CC   the expression of liver related homologue-1 (LRH1) and splice variants
CC   thereof. Specifically, it refers to compositions 8-30 nucleobases in
CC   length that target a portion of an active site on the nucleic acid
CC   molecule encoding LRH1 (also known as NR5A2). LRH1 is a monomeric orphan
CC   nuclear receptor protein that functions as a tissue specific
CC   transcription factor. The present invention describes antisense
CC   oligonucleotides that comprise at least one modified internucleoside
CC   linkage, a phosphorothioate linkage; at least one modified sugar moiety,
CC   a 2'-O-methoxyethyl (2' MOE) and at least one modified nucleobase, a 5-
CC   methylcytidine. These antisense compounds are useful for treating or
CC   diagnosing a disease associated with LRH1, such as breast cancer,
CC   dyslipidaemia, atherosclerosis, low HDL (high density lipoprotein), high
CC   LDL (low density lipoprotein), hypercholesterolaemia, gall stones,
```

```
CC   triglyceridaemia, obesity, hepatitis B virus-mediated acute or chronic
CC   hepatitis, as well as hepatocellular carcinoma or a condition associated
CC   with aromatase activity. Accordingly, these compositions exhibit
CC   cytostatic, antilipaemic, antiarteriosclerotic, anorectic, hepatotropic,
CC   litholytic, antiinflammatory and virucidal activities. This
CC   oligonucleotide sequence is an antisense DNA oligo used to modulate the
CC   expression of the human LRH1 protein of the invention.

PT   New antisense compound, having a sequence targeted to a nucleic acid
PT   encoding endothelial specific molecule-1 (ESM-1), useful for preparing a
PT   composition for treating e.g., diabetes, cancer or cardiovascular
PT   disorder.
XX
PS   Claim 3; SEQ ID NO 1815; 555pp; English.
XX
CC   The invention describes a new antisense compound, having a sequence
CC   comprising 8-30 bp targeted to a nucleic acid encoding endothelial
CC   specific molecule-1 (ESM-1), that specifically hybridises with the
CC   nucleic acid ESM-1 and inhibits its expression. Also described are: a
CC   composition; inhibiting the expression of ESM-1 in cells or tissues; and
CC   treating an animal having a disease or condition associated with ESM-1.
CC   The compound is useful for preparing a composition for treating diabetes,
CC   cancer, ischaemia or reperfusion injury, or angiogenic, immunological,
CC   cardiovascular or neurological disorder. This sequence represents an
CC   antisense oligonucleotide that can be used to modulate expression of
CC   endothelial specific molecule-1 (ESM-1).

PT   New antisense compound, having a sequence targeted to a nucleic acid
PT   encoding endothelial specific molecule-1 (ESM-1), useful for preparing a
PT   composition for treating e.g., diabetes, cancer or cardiovascular
PT   disorder.
XX
PS   Claim 3; SEQ ID NO 1618; 555pp; English.
XX
CC   The invention describes a new antisense compound, having a sequence
CC   comprising 8-30 bp targeted to a nucleic acid encoding endothelial
CC   specific molecule-1 (ESM-1), that specifically hybridises with the
CC   nucleic acid ESM-1 and inhibits its expression. Also described are: a
CC   composition; inhibiting the expression of ESM-1 in cells or tissues; and
CC   treating an animal having a disease or condition associated with ESM-1.
CC   The compound is useful for preparing a composition for treating diabetes,
CC   cancer, ischaemia or reperfusion injury, or angiogenic, immunological,
CC   cardiovascular or neurological disorder. This sequence represents an
CC   antisense oligonucleotide that can be used to modulate expression of
CC   endothelial specific molecule-1 (ESM-1).

PT   New compounds, particularly oligonucleotides targeted to a nucleic acid
PT   encoding ATP-binding cassette C2 (ABCC2), useful for treating disease or
PT   condition that affects drug clearance.
XX
PS   Example 15; SEQ ID NO 85; 54pp; English.
XX
CC   The invention relates to a compound targeted to a nucleic acid molecule
CC   encoding the human ATP-binding cassette subfamily C (ABCC2) polypeptide.
CC   The compound is an antisense oligonucleotide that specifically hybridises
CC   with the nucleic acid and inhibits expression of the polypeptide. The
CC   antisense oligonucleotide comprises at least one modified internucleoside
CC   linkage i.e. a phosphorothioate linkage, at least one modified sugar
CC   moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one
CC   modified nucleobase comprising a 5-methylcytosine. The antisense
CC   compounds are useful for modulating the expression of the human ABCC2
CC   polypeptide and in preparation of a composition for treating disorders
CC   associated with ABCC2, such as diseases or conditions that affect drug
CC   clearance. This sequence represents DNA encoding the human ABCC2
CC   polypeptide of the invention. This sequence represents an antisense
CC   oligonucleotide targeted to human ABCC2 DNA of the invention.

PT   New site-specific Listeria species integration vector, useful in
PT   eliciting or boosting a cellular immune response, in preparing vaccine or
PT   in research or in Listerial delivery preparation applications.
XX
PS   Example; SEQ ID NO 17; 17pp; English.
XX
CC   The invention relates to an integration vector capable of site-specific
CC   Listeria genome integration. Also included are transforming a Listeria
CC   (comprising contacting the Listeria with an integration vector under
CC   conditions sufficient for the integration vector to integrate into the
CC   genome of Listeria), a Listeria transformed with a vector, eliciting or
CC   boosting a cellular immune response to an antigen in a subject comprises
CC   administering to the subject an amount of vector transformed Listeria
CC   cells, a vaccine comprising a strain of Listeria cells of (2), which
CC   express a heterologous antigen; a recombinant culture of vector
CC   transformed Listeria cells, a kit, for preparing a vector or a cell
CC   (comprising a vector, at least one nuclease that cuts the vector at the
CC   multiple cloning site and a Listeria cell, a system for preparing the
CC   vaccine comprising a vector, at least one nuclease that cuts the vector
CC   at the multiple cloning site, a coding sequence for the heterologous
CC   antigen and Listeria cells). The integration vector comprises a
CC   bacteriophage (listeriophage) integrase gene and a bacteriophage
CC   attachment site. The attachment site provides for integration at an
CC   integration site, the comK or the tRNAArg integration site. The
CC   integration vector further includes a multiple cloning site and a coding
CC   sequence encoding a polypeptide, specifically an antigen. The integration
CC   vector and methods are useful in eliciting or boosting a cellular immune
CC   response, in preparing vaccine or in research or in Listerial delivery
CC   preparation applications. The present sequence is an inverse PCR primer
CC   (for tRNAArg/PSA attachment site (attBB')) used in the construction of
CC   the integrating vector pPL2.

XX
CC This invention describes a novel method for identifying an inhibitor
CC potentially useful for treatment of cancer, where the inhibitor is active
CC on a gene vital for cell growth or viability, and where the gene is
CC subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is
CC used for preventing the development of cancer in a patient having a
CC precancerous condition, by administering to the patient a first allele
CC specific inhibitor (ASI) targeted to an allele of a first essential gene
CC present in cells of the precancerous condition, where the normal somatic
CC cells of the patient are heterozygous for the first gene, the inhibitor
CC is active on at least one but less than all allelic forms of the gene
CC present in a population and targets only one allelic form present in the
CC normal somatic cells, and the first gene. The products and methods can be
CC used in the diagnosis, prevention and treatment of LOH disorders, e.g.
CC cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic
CC lesions, benign tumours, endometriosis, polycystic kidney disease, and
CC graft versus host disease. The method can also be used to remove
CC malignant cells from bone marrow transplants. AAZ25812-Z26825 represent
CC human polymorphic sites described in the method of the invention

PT Novel MUC nucleic acid corresponding to mucin gene, useful for treating
PT associated disease conditions e.g. colorectal, breast cancer, cystic
PT fibrosis and inflammatory bowel disease.
XX
PS Example 7; Page 40; 103pp; English.
XX
CC The invention provides mucin genes (MUC11 and MUC12) located on human
CC chromosome 7q22. The mucin genes or its portion is used in detecting
CC polymorphism, mutation, deletion, truncation and expansion in the gene or
CC its gene transcript. Pharmaceutical compositions and gene therapy
CC constructs comprising the mucin genes are used for treating disease
CC conditions associated with aberrant Mucin expression, altered properties
CC of mucus or epithelial inflammatory processes involving Mucins like
CC Crohn's disease, ulcerative colitis, asthma, chronic bronchitis and
CC colorectal cancer, cystic fibrosis, inflammatory bowel disease and breast
CC cancer. The mucin genes and the polypeptides are used for determining
CC these diseases or their predisposition. The MUC11 and MUC12 polypeptides
CC are used for preparing antagonist and antibodies. Sequences AAZ58833-34
CC represent beta2-microglobulin gene specific primers

PT Detecting the presence or diagnosing the risk of cancer or benign tumor,
PT e.g. an ovarian, endometrial or prostate cancer, by determining the
PT presence of or detecting aberrant expression of KLK4 in a biological
PT sample from the patient.
XX
PS Example 2; Page 67; 126pp; English.
XX
CC The present invention describes a method (M1) for detecting the presence
CC or diagnosing the risk of cancer or benign tumour in a patient. M1
CC comprises determining the presence of or detecting aberrant expression of
CC KLK4 in a biological sample obtained from the patient. KLK4 has

```
CC   cytostatic activity. The method is useful for detecting the presence or
CC   diagnosing the risk of a cancer or a benign tumour in a patient,
CC   particularly an ovarian, endometrial or prostate cancer, or a cancer or
CC   benign tumour associated with an organ or tissue from the ovaries,
CC   endometrium or prostate. An agent which can be used for restoring or
CC   modulating KLK4 expression can be used for treating or preventing cancer
CC   or benign tumour. KLK4 polynucleotides, polypeptides or antigen-binding
CC   molecules from the present invention can be used for detecting aberrant
CC   KLK4 polynucleotides or aberrant K4 polypeptides that correlate with a
CC   cancer or a benign tumour. The present sequence represents a PCR primer
CC   for beta-2-microglobulin, which is used in an example from the present
CC   invention

PT   Detecting the presence or diagnosing the risk of prostate cancer in a
PT   patient by detecting a level or functional activity of an aberrant
PT   prostate specific antigen or kallikrein 2 expression product in a
PT   biological sample.
XX
PS   Example 2; SEQ ID NO 28; 84pp; English.
XX
CC   The present sequence is that of a forward primer for human beta2-
CC   microglobulin. Use with a reverse primer ADF18210 generates a 238 bp
CC   product. RT-PCR was used to examine kallikrein 2 (KLK2) and prostate
CC   specific antigen (PSA) mRNA species in prostate cancer and benign
CC   prostate hyperplasia (BPH) tissues. The primer pair was also used in a
CC   real-time PCR analysis. The invention is based on the discovery that
CC   patients with prostate cancer produce different levels of aberrant
CC   transcripts, and presumably of aberrant polypeptides, corresponding to
CC   the PSA and KLK2 genes compared to patients with BPH. The invention
CC   provides a method for detecting the presence or diagnosing the risk of
CC   prostate cancer in a patient, based on detecting a level or functional
CC   activity of an aberrant expression product of a PSA or KLK2 gene which
CC   correlates with the presence of risk of prostate cancer. Claimed methods
CC   for the treatment and/or prophylaxis of prostate cancer involve
CC   administering an antisense oligonucleotide, a ribozyme or an RNAi-
CC   mediated molecule that binds to, or specifically interacts with, an
CC   aberrant transcript of a PSA or KLK2 gene, or administering an antigen-
CC   binding molecule that is immuno-reactive with an aberrant PSA or KLK2
CC   polypeptide, or administering an antigen-presenting cell expressing a
CC   processed form of the aberrant polypeptide for presentation to, and
CC   modulation of, T-cells.

PT   Detecting thyroid epithelial cells in blood - by detecting cDNA from
PT   thyroid-specific RNA, particularly for monitoring treatment and recovery
PT   from thyroid cancer following thyroidectomy.
XX
PS   Claim 29; Page 63; 80pp; English.
XX
CC   AAV74143-V74155 are PCR primers and probes used to detect thyroid
CC   epithelial cells (TEC) in a patient. The detection method comprises
CC   detecting a transcript of a thyroid-specific gene in a sample of reverse-
CC   transcribed total RNA of blood cells. The specification also describes a
CC   method for detecting TEC by polymerase chain reaction (PCR) of reverse-
CC   transcribed RNA (not necessarily total RNA) from blood cells, using
CC   primers that produce an amplicon that spans at least one intron, then
CC   detecting the PCR product and also a method for monitoring recurrence of
CC   thyroid cancer in a recovering patient by detecting, in a sample of
CC   reverse-transcribed total RNA of blood cells, a transcript of a thyroid-
CC   specific gene as an indicator of recurrence. The specification also
CC   describes a method for detecting TEC by cell-sorting to isolate a TEC-
CC   containing fraction from blood, then detecting TEC in this fraction. The
CC   methods are used to monitor treatment of, and recovery from, thyroid
CC   cancer, in patients who have had a total thyroidectomy. The method does
CC   not require the patient to stop thyroid hormone replacement therapy and
CC   is not subject to interference from antibodies against thyroglobulin
CC   which may falsify the conventional immunoassay. Peripheral blood is an
CC   easily obtained source of sample and the process is more sensitive than
CC   immunoassay. By amplifying fragments from several thyroid specific genes,
CC   even rare forms of thyroid cancer may be diagnosed

PT   Novel nucleic acid encoding replication competent recombinant hepatitis C
PT   virus genome useful for screening anti-hepatitis C virus therapeutics and
PT   for vaccine development.
XX
PS   Example 1; Page 75; 85pp; English.
XX
CC   The present invention provides protein and coding sequences from
CC   Hepatitis C virus (HCV), comprising all or part of the HCV genome and
CC   able to replicate efficiently when transfected into a susceptible cell
CC   line without reducing the growth rate of the cell line by more than 10
CC   fold. The sequences are useful for screening for anti-HCV therapeutics,
CC   for detecting antibodies to HCV in a biological sample such as blood,
CC   serum, plasma, blood cells, lymphocytes, or liver cells from a subject,
CC   for deriving authentic HCV components such as replication-complement non-
CC   infectious, replication-defective infection-component, and replication-
CC   defective non-infectious HCV, in gene therapy or gene vaccination
CC   targeted to hepatic tissue for treating an animal infected or susceptible
CC   to HCV infection and for studying HCV infection and propagation. The
CC   present sequence is a PCR primer used to amplify the HCV NS5B region in
CC   the exemplification of the invention

PT New CYP1A2 polynucleotide and polypeptide, useful for the preparation of
PT a diagnostic or therapeutic composition for cancer, congenital jaundice,
PT porphyria cutanea tarda or tardive dyskinesia in schizophrenia.
XX
PS Example 1; Page 38; 117pp; English.
XX
CC The invention relates to a novel polynucleotide comprising any of 37 11-
CC 761 base pair sequences, given in the specification, encoding a
CC polypeptide with any of 4 28-31 residue amino acid sequences, in the
CC specification, hybridising to a CYP1A2 gene, or encoding a CYP1A2
CC polypeptide or fragment comprising an amino acid substitution at position
CC 61, 298, 401 or 438. A polypeptide of the invention has cytostatic,
CC hepatotropic, dermatological, and cerebroprotective activity. A
CC polynucleotide of the invention may act as a CYP1A2-antagonist or CPY1A2-
CC agonist, and may have a use in gene therapy. The methods and compositions
CC of the present invention are useful for the preparation of a diagnostic
CC or therapeutic composition for a disease, in particular cancer,
CC congenital jaundice, porphyria cutanea tarda or tardive dyskinesia in
CC schizophrenia. The sequences shown in ACC90635-ACC90686 represent PCR
CC primer used in the invention to screen for polymorphisms within CYP1A2

PT New polypeptides and polynucleotides having properties related to
PT stimulation of biochemical or physiological responses in a cell or
PT tissue, useful for diagnosing or preventing e.g. atherosclerosis,
PT hypertension, prostate cancer.
XX
PS Example C; Page 332; 849pp; English.
XX
CC The invention relates to an isolated polypeptide comprising one of 127
CC sequences (appearing as ABO1288-ABO1414) designated as NOVX, a mature
CC form of NOVX, an amino acid sequence which is at least 95% identical to
CC NOVX or an amino acid sequence comprising one or more conservative
CC substitutions in NOVX. Also included are nucleic acids encoding NOVX
CC proteins, determining the presence or amount of NOVX or NOVX DNA in a
CC sample (by introducing the sample to an antibody that binds
CC immunospecifically to the polypeptide, and determining the presence or
CC amount of antibody bound to the polypeptide), determining the presence of
CC or predisposition to a disease associated with altered levels of
CC expression of NOVX or NOVX DNA in a first mammalian subject, identifying
CC an agent that binds to NOVX, identifying a potential therapeutic agent
CC for treatment of a pathology related to aberrant expression or aberrant
CC physiological interactions of NOVX, screening for a modulator of activity

```
CC   of or of latency or predisposition to a pathology associated with NOVX, a
CC   vector comprising NOVX DNA, a cell comprising the vector (used to produce
CC   NOVX) and an anti-NOVX antibody. The NOVX nucleic acids and polypeptides
CC   are useful as a marker for cell or tissue type, and in diagnosing and
CC   treating pathologies, diseases, conditions or disorders associated with
CC   NOVX sequences, including cardiomyopathy, atherosclerosis, hypertension,
CC   congenital heart defects, prostate cancer, diabetes, metabolic disorders,
CC   neoplasm, graft versus host disease, AIDS, bronchial asthma, Crohn's
CC   disease, multiple sclerosis, infectious diseases, anorexia, cancer-
CC   associated cachexia, neurodegenerative disorders (e.g. Alzheimer's
CC   disease or Parkinson's disease), immune disorders, haematopoietic
CC   disorders, dyslipidaemias, and wasting disorders associated with chronic
CC   diseases. These may also be used to screen for molecules which inhibit or
CC   enhance NOVX activity or function, and for detecting specific cell types.
CC   These may also be used in chromosome mapping, gene therapy, tissue
CC   typing, and in forensic biology. The present sequence is a reverse
CC   transcriptase (RT)-PCR primer used to assess the tissue specific
CC   expression of mRNA encoding a NOVX protein

PT   Designing primers for simultaneous amplification of target DNA fragments
PT   in a single multiplex polymerase chain reaction, for high throughput
PT   multiplex DNA sequence amplification, comprises aligning two primers.
XX
PS   Disclosure; Page 33; 120pp; English.
XX
CC   The invention relates to a method of designing primers for simultaneous
CC   amplification of target DNA fragments in a single multiplex polymerase
CC   chain reaction by aligning a first primer and a second primer. The method
CC   comprises: (a) aligning a first primer and a second primer; and (b)
CC   selecting the first primer where the first primer at its 3' end does not
CC   contain four or more bases that are perfectly matching to the 3' end
CC   sequence of the first primer or a second primer, the first primer at its
CC   3' end does not contain seven or more bases that are perfectly matching
CC   except one mismatch to the 3' end sequence of the first primer or the
CC   second primer, the first primer at its 3' end does not contain six or
CC   more bases that are perfectly matching to a sequence anywhere of the
CC   first primer or the second primer, and the first primer at its 3' end
CC   does not contain eleven or more bases that are perfectly matching except
CC   one mismatch to a sequence anywhere of the first primer or the second
CC   primer. The method is useful for designing primers for simultaneous
CC   amplification of target DNA fragments in a single multiplex polymerase
CC   chain reaction. It is also useful in the identification of multiple genes
CC   related to multifactorial diseases, the genome-scale detection of genetic
CC   alterations, the studies in pharmacogenetic reactions, the genotyping
CC   genetic polymorphisms in a large population, the gene expression
CC   profiling in various samples and high throughput genotyping technologies.
CC   This sequence corresponds to an example of a primer of the invention.

XX
CC The invention relates to the isolation of 6327 nucleotide sequences,
CC fragments of at least 15 consecutive nucleotides of these nucleotides, a
CC sequence having at least 80% identity, after optimal alignment, with the
CC nucleotides, a sequence that hybridizes under stringent conditions with
CC the nucleotides, or the complement, or corresponding RNA, of the
CC nucleotides. The nucleotides are used as probes or primers for detecting,
CC identifying, quantifying and/or amplifying nucleic acids, as in vitro
CC sense and antisense sequences, of nucleotides involved in tumour
CC suppression or reversion, apoptosis and or viral resistance, to produce
CC recombinant polypeptides, and to prepare transgenic animals, as
CC experimental models. The nucleotides (also vectors containing them and
CC cells containing the vectors), the encoded polypeptides and antibodies
CC (Ab) against the polypeptide are useful for prevention and/or treatment
CC of viral infections or diseases characterized by development of tumours
CC or cell degeneration (e.g. Alzheimer's disease or schizophrenia).
CC Analysis of the expression of the nucleotides can be used for diagnosis
CC and/or prognosis of these diseases. The nucleotides and polypeptides can
CC also be used to screen for their specific interactive molecules,
CC potentially useful for treating diseases associated with abnormal
CC expression of the nucleotides.

PT New truncated OTK18 transcriptional repressor protein, useful for
PT treating human immunodeficiency virus infection and for identifying OTK18
PT expression in a biological sample.
XX
PS Example 2; Fig 11A; 96pp; English.
XX
CC The invention relates to methods and compositions for the treatment of
CC human immunodeficiency virus (HIV) infection. The invention also relates
CC to OTK18 transcriptional repressor protein and its corresponding nucleic
CC acid. An antibody to OTK18 is useful for identifying OTK18 expression in
CC a biological sample (e.g. polymorphonuclear blood mononucleocytes, brain
CC tissue, macrophages and CD4+ T cells). OTK18 is used for treating HIV
CC infection. It is useful for screening molecules that modulate or affect
CC its activity. Its antibody is useful for identifying multinuclear giant
CC cells in HIV encephalitic brains or immune activated mononuclear
CC phagocytes (MP) in the brains, for fluorescent activated cell sorting
CC (FACS) analysis of peripheral blood cells to evaluate the antiretroviral
CC reaction of MP and for immunoprecipitating proteins from a sample
CC containing a mixture of proteins and other biological molecules. OTK18
CC molecules are useful in the treatment and diagnosis of HIV infection, as
CC research tools to identify the control of gene expression in response to
CC HIV infection and subsequent neuronal injury. OTK18 DNA is useful in gene
CC therapy. The present sequence is HIV-1 LTR luciferase reporter gene
CC derived mutant DNA fragment used to illustrate the method of the
CC invention

PT   characterization, grading, staging and/or diagnosis of colon cancer.
XX
PS   Claim 26; Page 159; 219pp; English.
XX
CC   The present invention describes a method for determining the methylation
CC   status of CpG dinucleotides within the genes for oestrogen receptor, p21,
CC   p27, p16, progesterone receptor, myoglobin, pcna, cdc2, c-erB2, p53
CC   and/or CEA, which comprises contacting the target nucleic acid with a
CC   reagent that distinguishes between methylated and non-methylated CpG
CC   dinucleotides, and determining from the methylation status of the CpG
CC   positions the presence of a colon cancer. A set of oligomers or peptide
CC   nucleic acid (PNA)-oligomers can be used as probes for determining the
CC   cytosine methylation state and/or single nucleotide polymorphisms (SNP)
CC   of a corresponding genomic DNA by analysis of a chemically pretreated
CC   genomic DNA. The pretreated genomic DNA is useful for the determination
CC   of the methylation status of a corresponding genomic DNA and/or detection
CC   of SNPs. The methods and pretreated genomic DNA are also useful for the
CC   characterisation, classification, diagnosis and differentiation of colon
CC   cell proliferative disorders. ACF62752 to ACF63278 represent sequences

XX
CC   The present invention describes a method for detecting and
CC   differentiating between haematopoietic cell proliferative disorders
CC   associated with at least 1 gene and/or their regulatory regions in a
CC   subject. The method comprises contacting a target nucleic acid in a
CC   biological sample obtained from the subject with at least 1 reagent,
CC   which distinguishes between methylated and non-methylated CpG
CC   dinucleotides within the target nucleic acid. ABZ09861 to ABZ11118
CC   represent specifically claimed nucleotide sequences from the present
CC   invention. Oligonucleotides from the present invention can be used: for
CC   differentiating between healthy haematopoietic cells and proliferative
CC   disorder haematopoietic cells; for differentiating between acute
CC   lymphocytic leukaemia and acute myelogenous leukaemia; as probes for
CC   determining the cytosine methylation state and/or single nucleotide
CC   polymorphisms (SNPs) of haematopoietic cell proliferation disorder
CC   related sequences and their complements; and as primers for the
CC   amplification of haematopoietic cell proliferation disorder related DNA
CC   sequences. The nucleotide sequences from the present invention can also
CC   be used for detecting a predisposition to, differentiation between
CC   subclasses, diagnosis, prognosis, treatment and/or monitoring of
CC   haematopoietic cell proliferative disorders. The present method enables a
CC   highly specific classification of haematopoietic cell proliferative
CC   disorders allowing for improved and informed treatment of patients

CC   The invention relates to a novel method for detecting and differentiating
CC   between colon cell proliferative disorders associated with at least one
CC   gene or its regulatory regions. The method comprises contacting a target
CC   nucleic acid in a biological sample obtained from the subject with at
CC   least one reagent or a series of reagents, where the reagent or series of
CC   reagents, distinguishes between methylated and non methylated CpG
CC   dinucleotides within the target nucleic acid. The molecules of the
CC   invention demonstrate cytostatic activity whilst the method may useful
CC   for detecting and differentiating between colon cell proliferative
CC   disorders, including cancers such as colon adenoma and colon carcinoma.
CC   The PNA (peptide nucleic acid)-oligomers are useful as probes for
CC   determining cytosine methylation state or single nucleotide
CC   polymorphisms. The current sequence is that of the hybridisation
CC   oligonucleotide of the invention which was used to analyse the genomic
CC   DNA region.

CC   Sequences shown in AAV41331 to AAV41340 represent exon specific primers
CC   of human interleukin (IL-9) gene. The invention provides a method for the
CC   treatment of inflammatory bowel disease (IBD) or related disorders that
CC   comprises administering a compound that up-regulates the function of IL-9
CC   or the IL-9 receptor. A method for monitoring humans undergoing IBD
CC   treatment with polypeptides with human IL-9 sequence (or fragments), by
CC   evaluating IL-9 levels in samples taken at different times, and a method
CC   for screening for cells expressing the IL-9 receptor by detecting binding
CC   of a specific ligand are also provided. Compounds up-regulating the
CC   function of IL-9 or the IL-9 receptor can be used therapeutically (in
CC   pharmaceutical compositions, optionally with acceptable carriers) to
CC   treat IBD and other related inflammatory disorders. IBDs (which include
CC   Crohn's diseases and chronic non-specific ulcerative colitis) are
CC   diseases characterised by an inappropriate inflammatory response to
CC   environmental stimuli. Immune responses to antigens are classified as Th1
CC   or Th2 responses, and evidence suggests that IBDs are dominated by a Th1
CC   mediated, antigen induced, inflammatory response. Other related Th1
CC   mediated diseases include multiple sclerosis, diabetes, arthritis, lupus
CC   and autoimmune diseases. The method is based on the observation that the
CC   Th2 response is up-regulated by IL-9

PT   Novel chemically modified genomic DNA sequences, useful in the
PT   characterization, classification, differentiation, grading, staging,
PT   treatment and/or diagnosis of astrocytomas or predisposition to
PT   astrocytomas.
XX
PS   Example; Page 25; 37pp; English.
XX
CC   The invention relates to a nucleic acid comprising a sequence (I) of at
CC   least 18 bases in length of a segment of chemically pre-treated genomic
CC   DNA which has any one of the sequences of (ABK33919-ABK34032) or its
CC   complement. Also included are an oligonucleotide or peptide nucleic acid
CC   (or set thereof) of at least 9 nucleotides which hybridises to (I),
CC   primers for (I), probes for detecting cytosine methylation or single-
CC   nucleotide polymorphisms (SNP) in (I), an array of oligomers or peptide
CC   nucleic acids for analysing diseases associated with the methylation
CC   states of the CpG dinucleotides of (I). The array is useful for
CC   determining genetic and/or epigenetic parameters, classification,
CC   differentiation, grading, staging, treatment and/or diagnosis of
CC   astrocytomas, or the predisposition to astrocytomas by analysing cytosine
CC   methylations, involves obtaining a biological sample containing genomic
CC   DNA, extracting the genomic DNA, converting cytosine bases which are
CC   unmethylated at the 5-position, in the genomic DNA sample, to uracil or
CC   another base which is dissimilar to cytosine in terms of hybridisation
CC   behaviour, by chemical treatment and amplifying chemically pre-treated
CC   genomic DNA fragments using the array and a polymerase, where the
CC   amplificates carry a detectable label. The method further involves
```

```
CC   identifying methylation status of one or more cytosine positions, and
CC   analysing methylation status of the cytosine positions by reference to
CC   one or more data sets. The genomic DNA is chemically treated by using a
CC   bisulphite, hydrogen sulphite or disulphite. The amplification step
CC   amplifies DNA which is of particular interest in astrocytoma or brain
CC   tissue, based on the specific genomic methylation status of brain
CC   tissues, as opposed to background DNA. The amplificates carry a
CC   fluorescent label or radionuclide. Optionally, the labels of the
CC   amplificates are detachable molecule fragments having a typical mass
CC   which are detected in a mass spectrometer. The fragments of chemically
CC   pre-treated genomic DNA to be amplified, have a single positive or
CC   negative charge for a better detectability in the mass spectrometer.
CC   Preferably, the amplificates or fragments of the amplificates are
CC   detected by matrix assisted laser desorption/ionization mass spectrometry
CC   (MALDI) or using electron spray mass spectrometry (ESI). The present
CC   sequence is a PCR primer used to amplify a region containing a methylated
CC   cytosine from one of the chemically pre-treated reference DNA samples of
CC   the invention. Note: The sequence data for this patent did not form part
CC   of the printed specification, but was obtained in electronic format
CC   directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

CC   The invention relates to a nucleic acid (I) comprising a sequence of at
CC   least 18 bases of a segment of chemically pretreated genomic DNA (II)
CC   according to one of the sequences (S1) selected from 120 sequences, and
CC   its complementary sequences. Also included are an oligomer (III),
CC   especially an oligonucleotide or peptide nucleic acid (PNA)-oligomer,
CC   comprising a sequence of at least 9 nucleotides which hybridises to or is
CC   identical to (II), and complementary sequences, a set of oligomers (IV)
CC   comprising at least two (III) and their use for detecting the cytosine
CC   methylation state and/or single nucleotide polymorphisms (SNPs) in (II),
CC   and manufacturing (M1) an arrangement of different oligomers (array)
CC   fixed to a carrier material for analysing diseases associated with the
CC   methylation state of the CpG dinucleotide of (S1), where at least one
CC   oligomer is coupled to solid phase. The set of oligomers (IV) are useful
CC   as primer oligonucleotides for the amplification of (II) especially for
CC   characterising classifying and differentiating oligodendroglioma,
CC   astrocytoma and oligoastrocytoma tumours (by ascertaining genetic and/or
CC   epigenetic parameters of genomic DNA by analysing cytosine methylation
CC   and single nucleotide polymorphisms). The present sequence is a PCR
CC   primer used to amplify the modified genomic sequence from a gene
CC   associated with brain tumours

PT   Method for characterizing, classifying and/or differentiating renal and
PT   prostate cancers, by analyzing the genetic and/or epigenetic parameters
PT   of genomic DNA, particularly by determining its cytosine methylation
PT   status.
XX
PS   Example 2; Page 17; 211pp; English.
XX
CC   The invention relates to a novel method for characterising, classifying
CC   and/or differentiating renal and prostate cancer. The method comprises
CC   extracting genomic DNA from a biological sample, converting cytosine
CC   bases (by chemical treatment) that are unmethylated at the 5-position to
CC   uracil or another base, and amplifying at least one fragment of the
CC   chemically pretreated genomic DNA using sets of primer oligonucleotides
CC   and a polymerase. The method is useful for detecting the cytosine
CC   methylation state and/or single nucleotide polymorphisms in genomic DNA,
CC   particularly for characterising, classifying and/or differentiating renal
CC   and prostate cancers. The oligomers are useful as primer oligonucleotides
CC   for the amplification of any of the 112 DNA sequences of the invention.
CC   The set of oligomer probes is useful for detecting the cytosine
CC   methylation state and/or single nucleotide polymorphisms in any of the
CC   112 chemically pretreated genomic DNA sequences. The method is also
CC   useful for identifying the tissue of origin of cancer cells. The method
CC   allows the classification, differentiation and/or diagnosis of cancer
CC   tissues using minute samples which would be inadequate for histological
CC   or cytological analysis. The present sequence is used in the
CC   exemplification of the invention.

PT   encoding endothelial specific molecule-1 (ESM-1), useful for preparing a
PT   composition for treating e.g., diabetes, cancer or cardiovascular
PT   disorder.
XX
PS   Claim 3; SEQ ID NO 1319; 555pp; English.
XX
CC   The invention describes a new antisense compound, having a sequence
CC   comprising 8-30 bp targeted to a nucleic acid encoding endothelial
CC   specific molecule-1 (ESM-1), that specifically hybridises with the
CC   nucleic acid ESM-1 and inhibits its expression. Also described are: a
```

```
CC   composition; inhibiting the expression of ESM-1 in cells or tissues; and
CC   treating an animal having a disease or condition associated with ESM-1.
CC   The compound is useful for preparing a composition for treating diabetes,
CC   cancer, ischaemia or reperfusion injury, or angiogenic, immunological,
CC   cardiovascular or neurological disorder. This sequence represents an
CC   antisense oligonucleotide that can be used to modulate expression of
CC   endothelial specific molecule-1 (ESM-1).

PT   Regenerating nervous tissue, involves contacting the tissue with Schwann
PT   cells expressing DeltaSCIP to regenerate the nervous tissue.
XX
PS   Disclosure; Page 5; 21pp; English.
XX
CC   The invention relates to regenerating nervous tissue, involves contacting
CC   the tissue with Schwann cells expressing DeltaSCIP (a mutant form of the
CC   SCIP (not defined) gene under control of the P0 promoter (a myelin
CC   structural protein). SCIP is a transcription factor also known as Oct-6
CC   and Tst-1) to regenerate the nervous tissue. Also included are treating a
CC   subject in need of nervous tissue regeneration, by introducing Schwann
CC   cells expressing DeltaSCIP and inducing nervous tissue regeneration in a
CC   subject in need of such treatment, by administering to the subject,
CC   DeltaSCIP to induce nervous tissue regeneration in the subject. The
CC   methods are useful for useful for regenerating nervous tissue and for
CC   treating a subject in need of nervous tissue regeneration, where the
CC   subject in need of nervous tissue regeneration has a neurodegenerative
CC   disease. The neurodegenerative disease is Alzheimer's disease, Pick's
CC   disease, Huntington's disease, Parkinson's disease, cerebral palsy,
CC   amyotrophic lateral sclerosis (ALS), muscular dystrophy, multiple
CC   sclerosis, myasthenia gravis, or Binswanger's disease. The subject in
CC   need of nervous tissue regeneration has one or more damaged neurons. The
CC   damage to the neurons are caused by vascular lesions of the brain and
CC   spinal chord, trauma to the brain and spinal chord, cerebral haemorrhage,
CC   intracranial aneurysms, hypertensive encephalopathy, subarachanoid
CC   haemorrhage or developmental disorders. The developmental disorder is a
CC   disorder of the brain or spinal cord e.g. congenital hydrocephalus or
CC   spina bifida. The present sequence is a PCR primer used to genotype mice
CC   which are transgenic for the P0/deltaSCIP construct

PT New (microarray) apparatus comprising a substrate with attached nucleic
PT acid probes, useful for detecting one or more microbes in a sample.
XX
PS Claim 29; SEQ ID NO 109; 89pp; English.
XX
CC This invention relates to a novel apparatus for detecting a microbe in a
CC sample which comprises a substrate having multiple microbe identification
CC sites, each having a unique address indicative of the position of that
CC microbe identification site on the substrate and groups of nucleic acid
CC probes disposed at the microbe identification sites, each group being
CC complementary to a target nucleic acid to provide a detectable signal at
CC one or more microbe identification sites. The apparatus is useful for
CC detecting the presence of one or more microbes in a sample, such as virus
CC or viral particle, (non-)pathogenic bacteria, or cellular or acellular
CC microbe. The apparatus is particularly useful for clinical diagnosis,
CC research, epidemiological surveillance, bioterrorism countermeasures,
CC environmental pathogen surveys, and monitoring food contaminants. Current
CC testing procedures or devices, such as radioimmunoassays and ELISA, are
CC difficult to implement, time consuming, expensive, outdated, and
CC typically rely on the use of agents that recognise and bind to membrane
CC bound proteins or carbohydrates of the pathogen. These further cannot
CC assay multiple pathogens. The new apparatus or device for detecting
CC microbes overcomes these disadvantages. The apparatus is compact,
CC sensitive, and quick to detect the presence of any of a number of
CC pathogens present in a sample. The present sequence is that of a PCR
CC primer which is related to the micorbe detection apparatus of the
CC invention.

PT Brassica species allele-specific oligonucleotide probes and primers -
PT useful for plant breeding.
XX
PS Example 1; Page 50; 65pp; English.
XX
CC AAV51705-V52008 are reverse PCR primers used to amplify fragments of the
CC Zea mays genome in order to detect polymorphic markers. Such markers can
CC be used in the construction of allele-specific primers and probes for
CC amplification or hybridisation, e.g. to determine common or disparate
CC ancestry between 2 or more plants, to monitor the genetic contribution of
CC an ancestral plant, to trace the progeny of proprietary plants, in
CC certification of a hybrid plant or to identify the progeny of a back-
CC crossed plant with an ancestral plant

PT Characterizing a metabolic phenotype for an immunosuppressant agent,
PT comprises administering a probe substrate specific to a metabolic pathway
PT of the determinant and detecting metabolites of the pathway.
XX
PS Disclosure; Page 79; 225pp; English.
XX
CC The invention relates to characterising a multi-determinant metabolic
CC phenotype (P) for an immunosuppressant agent. The method involves: (a)
CC administering to an individual a probe substrate specific to a metabolic
CC pathway for an immunosuppressant agent; (b) detecting metabolites of MPs
CC in a biological sample from the individual; and (c) characterizing
CC respective phenotypic determinants of (P). The method is useful for
CC characterizing a multi-determinant metabolic phenotype for an
CC immunosuppressant agent such as cyclosporine, Tacrolimus (RTM),
CC Sirolimus, Prednisone, Cellcept (RTM) and OKT3. (P) can be used to
CC individualize a treatment regimen for an immunosuppressant agent for an
CC individual, by determining (P) of the individual using the method, and
CC determining/selecting a safe and therapeutically effective dose of the
CC immunosuppressant agent for treatment based on (P) of the individual. A
CC new method of genotyping individuals to identify those lacking an allelic
CC variation known to prompt toxicity of the immunosuppressant agent, and
CC characterizing (P) of the identified individual to determine each
CC individual's ability to metabolize the immunosuppressant agent is also
CC provided. This is useful for identifying those individuals at high risk
CC for serious adverse events. The present sequence represents an allele-
CC specific primer used for genotyping the N-acetyltransferase (NAT1) gene,
CC by amplifying NAT1*14 allele

PT Characterizing multi-determinant metabolic phenotypes of N-(aryl
PT substituted)-naphthalidimide compounds, useful for individualizing
PT therapy with amonafide, comprises determining metabolic phenotype from
PT detected metabolites.
XX
PS Disclosure; Page 89; 351pp; English.
XX
CC The invention relates to characterizing a multi-determinant metabolic
CC phenotype for a class of N-(aryl substituted)-naphthalidimide compounds
CC (I) (the phenotypic determinants correspond to respective metabolic
CC characteristics). The method involves (a) administering to an individual
CC a probe substrate specific to metabolic pathway(s) of (I); (b) detecting
CC metabolites of the pathway in a biological sample in response to the
CC probe substrate; and (c) characterizing the determinants of the metabolic
CC phenotype based on detected metabolites. The method is useful for the
CC individualization of treatment with the anticancer drug, amonafide, on
CC the basis of a phenotypic profile of an individual. It may also be used
CC in research and in the development of new drugs. The present sequence
CC represents an allele specific PCR primer for amplifying the NAT1*14
CC allele, used in NAT1 genotyping

XX
PT   Characterizing metabolic phenotype based on phenotypic determinants, by
PT   administering a probe substrate specific to a metabolic pathway of the
PT   determinant and detecting metabolites of pathway in response to
PT   substrate.
XX
PS   Disclosure; Page 78; 268pp; English.
XX
CC   The sequences given in ABA00250-87 are primers which were used in the
CC   method of the invention for characterizing multi-determinant metabolic
CC   phenotype based on a number of phenotypic determinants (PDs). The method
CC   comprises administering to an individual a probe substrate (PS) specific
CC   to a metabolic pathway (MP) of each of the PDs, detecting metabolites of
CC   MPs in a biological sample from the individual in response to PS, and
CC   characterizing respective PDs of metabolic phenotypes based on detected
CC   metabolites. This primer is used in the determination of the N-acetyl
CC   transferase (NAT1) alleles NAT1*4 (wt) and the mutant NAT1*14 (A560G).
CC   The first PCR reaction produces a 175 bp fragment which when incubated
CC   with BsaI is cleaved in the presence of NAT1*4, but NAT1*14 is uncleaved.
CC   The NAT1*14 allele is confirmed using the second PCR reaction. Knowledge
CC   of the metabolic phenotype is useful for determining a combination drug
CC   therapy where an individual's phenotype is indicative of a fast
CC   metabolizer, and a corresponding inhibitor is selected for combined
CC   treatment with a drug to improve the therapeutic effect in the
CC   individual. The method of the invention is useful for diagnosing a
CC   disease or condition associated with altered function in a drug
CC   metabolizing enzyme. It is also useful for selecting a treatment for an
CC   individual corresponding to the individual's metabolic phenotype and for
CC   screening a number of individuals for participation in a drug treatment
CC   trial assessing the therapeutic effect of a candidate drug treatment

XX
CC The invention relates to characterising method for a multi-determinant
CC metabolic phenotype for a gastroesophageal reflux disease (GERD) agent.
CC The method involves administering to a subject a probe substrate specific
CC to metabolic pathway(s) for a GERD agent and detecting metabolites of the
CC pathway(s) in a sample from the subject in response to the substrate. The
CC method is useful for characterising a multi-determinant metabolic
CC phenotype for at least one GERD agent such as H_2-receptor antagonists,
CC promotility agents and proton pump inhibitors. The multi-determinant
CC metabolic phenotype is comprised of at least one determinant indicative
CC of an individual's metabolic capacity for at least one drug metabolising
CC enzyme, such as N-acetyltransferase-1 (NAT-1), NAT-2, CYP1A2, CYP2D6,
CC CYP2A6, CYP2E1, CYP2C9, CYP2C19, UGTs, GSTs, and STs, preferably CYP3A4.
CC The characterising method is useful to individualise a treatment regimen
CC for at least one GERD agent for an individual. This polynucleotide
CC sequence represents a PCR primer used in the characterising method of the
CC invention

XX
PS Disclosure; Page 247; 251pp; English.
XX
CC The invention relates to a method of characterizing a multi-determinant
CC metabolic phenotype for an antineoplastic agent. The method involves
CC administering to an individual a probe substrate specific to a metabolic
CC pathway for an antineoplastic agent, detecting metabolites of metabolic
CC pathway in a biological sample from the individual in response to probe
CC substrate, and characterising respective phenotypic determinants of
CC metabolic phenotype based on detected metabolites. The method is useful
CC for characterising a multi-determinant metabolic phenotype for an
CC antineoplastic agent such as taxanes, estrogen antagonists, camptothecin
CC derivatives, anthracyclines, alkylating agents, podophyllotoxins, vinca
CC alkaloids, receptor tyrosine kinase inhibitors, nitrosureas, platinum
CC analogues and antimetabolites. The present sequence is N-acetyl
CC transferase (NAT)1 allele specific PCR primer used to illustrate the
CC method of the invention

PT Characterizing a multi-determinant metabolic phenotype for an erectile
PT dysfunction agent, comprises administering a probe substrate to the
PT metabolic pathway of the agent and detecting metabolites in response to
PT the substrate.
XX
PS Disclosure; Page 89; 247pp; English.
XX
CC The specification describes a method for characterizing a multi-
CC determinant metabolic phenotype for a erectile dysfunction (ED) agent.
CC The method comprises administering to a subject a probe substrate
CC specific to the metabolic pathway(s) for an ED agent; detecting
CC metabolites of the pathway(s) in a sample from the subject in response to
CC the substrate; and characterizing respective phenotypic determinants of
CC the multi-determinant metabolic phenotype. The method is useful for
CC characterizing a multi-determinant metabolic phenotype for an ED agent
CC such as a phosphodiesterase 5 (PDE5) inhibitor, in particular sildenafil
CC Viagra (RTM). The multi-determinant metabolic phenotype is comprised of a
CC determinant indicative of an individual's metabolic capacity for a drug
CC metabolizing enzyme, such as N-acetyltransferase-1 (NAT-1), NAT-2,
CC cytochrome P450 (CYP)1A2, CYP2D6, CYP2A6, CYP2E1, CYP2C9, CYP2C19, UDP-
CC glucuronosyltransferase (UGT)s, glutathione-S-transferase (GST)s, and
CC stromelysin (ST)s, preferably CYP3A4. PCR primers ABZ23433-35 were used
CC to amplify fragments of the NAT-1 gene. The amplified fragment was
CC analysed by restriction analysis to identify the wild type and mutant
CC alleles. The primers were used for indirect phenotyping (genotyping) of
CC NAT-1, in the course of the invention

XX
CC   The present sequence is a primer used with the primer given in ABV76234
CC   in an allele-specific PCR to confirm the NAT1*14 allele of an N-
CC   acetyltransferase (NAT1) gene. Studies have demonstrated the presence of
CC   one wild-type allele and 6 mutant alleles of NAT1. NAT1 metabolizes
CC   several drugs (including the antimalarial dapsone) and dietary
CC   constituents, and activates some environmental procarcinogens. It has 2
CC   phenotypes: slow and rapid acetylators. The present invention relates to
CC   the individualization of therapy, especially of treatment with
CC   analgesics, on the basis of a phenotyping profile of an individual. In
CC   the case of NAT1, an example of indirect phenotyping (genotyping)
CC   involves the PCR amplification of a 175 bp fragment which includes an
CC   A560G mutation, using the present primer and the primer given in
CC   ABV76235. The 175 bp fragment is incubated with BsaI. The wild-type
CC   allele produces fragments of 155 and 20 bp, whereas mutant allele NAT1*14
CC   is uncleaved

PT   substrate.
XX
PS   Disclosure; Page 84; 237pp; English.
XX
CC   The present sequence is a primer for the PCR amplification of the N-
CC   acetyltransferase (NAT1) gene. NAT1 activity varies broadly in a given
CC   population. The NAT1*4 genotype is associated with slow drug metabolizers
CC   and is found at a frequency of 50%, 30% and 35% in Indian, Malaysian and
CC   Chinese populations, respectively. The NAT1*4 (wild-type) and the mutant
CC   NAT1*14 alleles can be determined by PCR-RFLP of a fragment of the gene
CC   containing an A560G mutation. PCR is performed with the primers fiven in
CC   ACF05571 and ACF05572. The 175 bp product is incubated with BsaI. The
CC   Nat1*1 allele produces 155 and 20 bp fragments, while the mutant NAT1*14
CC   is uncleaved. The NAT1*14 allele is confirmed using the present primer
CC   with the primer given in ACF05571. The present invention provides a
CC   method for using multi-determinant phenotyping for the individualization
CC   of treatment with an antihistamine, especially where the multi-
CC   determinant phenotype is comprised of a determinant indicative of an
CC   individual's metabolic capacity for a drug metabolizing enzyme such as
CC   NAT1. The method involves administering a probe substrate specific to the
CC   metabolic pathway of the antihistamine and detecting metabolites in
CC   response to the substrate

CC   The present invention describes a method (M1) for characterising the
CC   multi-determinant metabolic phenotype (MP) for at least one antiviral
CC   agent (I), which involves administering to a subject, a probe substrate
CC   specific to metabolic pathway(s) for (I), detecting metabolites of the
CC   pathway(s) in a sample from the subject in response to the substrate, and
CC   characterising respective phenotypic determinants of MP based on detected
CC   metabolites. (I) has virucide activity. (M1) is useful for characterising
CC   a multi-determinant metabolic phenotype for at least one antiviral agent
CC   such as nucleoside analogue reverse transcriptase inhibitor (NRT1), non-
CC   nucleoside reverse transcriptase inhibitor (NNRT1), a protease inhibitor
CC   (PI), an immune response modifier, preferably ritonavir. The multi-
CC   determinant metabolic phenotype is comprised of at least one determinant
CC   indicative of an individual's metabolic capacity for at least one drug
CC   metabolising enzyme, such as CYP3A4, or chosen from N-acetyltransferase-1
CC   (NAT-1), NAT-2, CYP1A2, CYP2D6, CYP2A6, CYP3A4, CYP2C9, CYP2C19, UGTs,
CC   GSTs and STs. (M1) is useful to individualise a treatment regimen for at
CC   least one antiviral agent compound for an individual. The method quickly
CC   and accurately determines phenotypic determinants for the metabolic
CC   pathways of drug metabolising enzymes, and avoids the severe side effects
CC   and frustration that accompany trial and error treatment. The present
CC   sequence represents a PCR primer for amplifying a NAT-1 mutant, which is
CC   used in the exemplification of the present invention

```
XX
CC   The invention relates to the use of genotyping for the individualization
CC   of therapy and/or treatment, where an individual is genotype for a
CC   specific metabolic factor and a corresponding genotypic determinant is
CC   characterized. The method is useful for the individualization of therapy
CC   and/or treatment, for quantifying an individualized dosage regime of a
CC   drug, and to identify an individual having a metabolic incompatibility
CC   with a selected therapy and/or treatment. The method is useful for the
CC   individualization of drug dosing, to identify individuals having a
CC   particular allelic variation known to influence the ability to
CC   effectively metabolize a given drug or class of drugs, to characterize a
CC   metabolic determinant and identify an individualized dosage for a given
CC   drug treatment regime, and for identifying those individuals who is at
CC   risk for a particular drug treatment regime. The method quickly and
CC   accurately determines phenotypic determinants for the CYP3A4 or CYP2D6
CC   metabolic pathway. Sequences ABZ75813-815 represent PCR primers for
CC   genotyping the NAT1 determinants

PT   Characterizing multi-determinant metabolic phenotype for anticoagulant
PT   agent by administering probe substrate specific to metabolic pathway for
PT   anticoagulant agent, detecting metabolites of pathway.
XX
PS   Disclosure; Page 160; 353pp; English.
XX
CC   The present invention relates to a method of characterising a multi-
CC   determinant metabolic phenotype for an anticoagulant agent, comprising
CC   administering to an individual a probe substrate specific to the
CC   metabolic pathway for the anticoagulant agent, detecting metabolites of
CC   the metabolic pathway in a biological sample from the individual in
CC   response to probe the substrate, and characterising the respective
CC   phenotypic determinants of the multi-determinant metabolic phenotype
CC   based on the detected metabolites. The method is useful for
CC   characterising a multi-determinant metabolic phenotype for one or more
CC   anticoagulant agents, where several phenotypic determinants are
CC   identified as corresponding to respective metabolic characteristics. The
CC   present sequence is a PCR primer used to genotype the human NAT1 gene in
CC   the exemplification of the invention.

PT   Characterizing multi-determinant metabolic phenotype for anesthetic by
PT   administering to individual substrate specific to metabolic pathways for
PT   anesthetic and determining phenotypic determinants based on metabolites
PT   of metabolic pathway.
XX
PS   Disclosure; SEQ ID NO 5; 74pp; English.
XX
CC   The invention relates to a method of characterising multi-determinant
CC   metabolic phenotype for anaesthetic. The method is useful for
CC   characterising multi-determinant metabolic phenotype for at least one
CC   anaesthetic. The method is useful for individualising a treatment regimen
CC   for at least one anaesthetic compound for an individual. The method is
CC   useful for administering to an individual at least one anaesthetic
CC   compound. The method is also useful for screening several individuals for
CC   participation in a drug treatment trial assessing the therapeutic effect
CC   of at least one anaesthetic compound. An assay system is useful in an
CC   enzyme-specific assay for the individualisation of administration of at
CC   least one anaesthetic compound. The present sequence represents a human N
CC   -acetyltransferase NAT1 PCR primer.

PT   Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n -
PT   using novel nucleic acid mols. as primers.
XX
PS   Disclosure; Col 11-12; 186pp; English.
XX
CC   The invention relates to the isolation of polymorphic repeat sequences
CC   having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic
CC   markers. Primers based on these sequences can be used to detect these
CC   repeats, especially for use in e.g paternity or maternity testing, human
CC   genetic analysis such as linkage analysis of genetic disease, commercial
CC   animal or plant breeding or pedigree analysis. Clones containing the
CC   repeat sequences were isolated by hybridisation of chromosome-specific
CC   phage libraries with a synthetic poly(dC-dA).(dG-dT) probe. Over 100
CC   repeat blocks were isolated. The primers AAT65798-T66047 were used to PCR
CC   amplify the inserts from the isolated clones containing the repeat
CC   sequences. The primers AAT65892-3 were used to amplify the repeat
CC   sequence marker clone Mfd48 (AAT65748). (Updated on 25-MAR-2003 to
CC   correct PF field.)

PS   Example 3; SEQ ID NO 1206; 207pp; English.
XX
CC   The present invention describes a double-stranded short interfering
CC   nucleic acid (siNA) that downregulates expression of the vascular
CC   endothelial growth factor receptor (VEGFR) gene. Also described: (1) a
CC   siNA that downregulates the VEGF gene; (2) kits for in vitro or in vivo
CC   delivery of siNA; (3) conjugates and/or complexes of siNA; (4) vectors
CC   that express siNA; and (5) single-stranded siNA with similar properties.
CC   The siNAs have antiangiogenic, cytostatic, antidiabetic,
CC   ophthalmological, antiarthritic, antipsoriatic, nephrotropic and
CC   gynaecological activities. The siNA are useful for modulating
CC   (downregulating) the expression of VEGFR genes. The siNA are potentially
CC   useful for treating a wide range of angiogenesis-associated conditions,
CC   particularly cancers, diabetic retinopathy, macular degeneration,
CC   neovascular glaucoma, arthritis, psoriasis, endometriosis, angiofibroma,
CC   and polycystic kidney disease. The siNA may also be useful for diagnosis,
CC   drug screening, target identification and validation, genetic
CC   engineering, studying gene function, and also for gene mapping (e.g. of
CC   single-nucleotide polymorphisms). The present sequence is used in the
CC   exemplification of the present invention.

PT New double-stranded interfering nucleic acid, useful e.g. for treatment
PT and diagnosis of cancer, downregulates the vascular endothelial growth
PT factor receptor gene.
XX
PS Example 3; SEQ ID NO 199; 207pp; English.
XX
CC The present invention describes a double-stranded short interfering
CC nucleic acid (siNA) that downregulates expression of the vascular
CC endothelial growth factor receptor (VEGFR) gene. Also described: (1) a
CC siNA that downregulates the VEGF gene; (2) kits for in vitro or in vivo
CC delivery of siNA; (3) conjugates and/or complexes of siNA; (4) vectors
CC that express siNA; and (5) single-stranded siNA with similar properties.
CC The siNAs have antiangiogenic, cytostatic, antidiabetic,
CC ophthalmological, antiarthritic, antipsoriatic, nephrotropic and
CC gynaecological activities. The siNA are useful for modulating
CC (downregulating) the expression of VEGFR genes. The siNA are potentially
CC useful for treating a wide range of angiogenesis-associated conditions,
CC particularly cancers, diabetic retinopathy, macular degeneration,
CC neovascular glaucoma, arthritis, psoriasis, endometriosis, angiofibroma,
CC and polycystic kidney disease. The siNA may also be useful for diagnosis,
CC drug screening, target identification and validation, genetic
CC engineering, studying gene function, and also for gene mapping (e.g. of
CC single-nucleotide polymorphisms). The present sequence is used in the
CC exemplification of the present invention.

PT   New short interfering nucleic acid, useful e.g. for treatment and
PT   diagnosis of cancer, downregulates expression of Myc or Myb genes.
XX
PS   Example 7; Page 129; 161pp; English.
XX
CC   The invention relates to short interfering nucleic acids (siNA) which
CC   downregulate expression of the human Myc or Myb genes by RNA
CC   interference. The siNAs may or may not comprise ribonucleotides and may
CC   be double or single stranded. They further comprise sense and antisense
CC   regions, or alternatively are assembled from a sense oligonucleotide and
CC   an antisense oligonucleotide. Specifically, the siNAs include short
CC   interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short
CC   hairpin RNA (shRNA). The siNAs can be unmodified or chemically modified,
CC   can contain deoxyribonucleotides, and can be chemically synthesised,
CC   expressed from a vector or enzymatically synthesised. The 'invention also
CC   relates to kits for the in vitro or in vivo delivery of siNA; conjugates
CC   and/or complexes of siNA; and vectors that express siNA. The siNAs are
CC   used to modulate expression of the Myc or Myb genes in cells, tissue
CC   explants or organisms (e.g., by ex vivo gene therapy), or in grafts and
CC   transplants for the treatment of a variety of conditions. They may be
CC   used for treating cancers and other proliferative diseases, such as
CC   restenosis and polycystic kidney disease. The siNAs are also useful for
CC   drug screening, diagnosis, therapeutic target identification and
CC   validation, genetic engineering, pharmacogenomics, studying gene
CC   function, and gene mapping (e.g., of single nucleotide polymorphisms).
CC   The present sequence represents the lower strand of a human Myc-targeted
CC   double-stranded siNA.

PT   recognition elements.
XX
PS   Claim 1; SEQ ID NO 236; 82pp; English.
XX
CC   The present invention relates to an analytical chip for simultaneous
CC   determination of one or more different bacterial 16S-rRNA in liquid
CC   sample. The chip is useful for detecting one or more bacterial 16S-rRNA,
CC   derived from bacteria such as Achromobacter xylosoxidans , Acinetobacter
CC   baumannii , Actinomyces israelii , Aerococcus viridans , Aeromonas
CC   hydrophilia , Agrobacterium radiobacter , Bacillus sp. , Bacteroides
CC   ovatus , Campylobacter fetus , Citrobacter freundii , Enterococcus avium
CC   , Eubacterium lentum , Escherichia coli , Flavobacterium breve ,
CC   Fusobacterium nucleatum , Gemella morbillorum , Gardnerella vaginalis ,
CC   Haemophilus influenzae , Hafnia alvei , Kingella sp. , Klebsiella oxytoca
CC   , Lactobacillus acidophilus , Legionella pneumophila , Moraxella
CC   catarrhalis , Mycobacterium avium , Neisseria cinerea , Nocardia sp. ,
CC   Ochrobactrum anthropi , Pasteurella multocida , Peptostreptococcus magnus
CC   , Salmonella typhi , Shigella sonnei , Veillonella parvula , Veillonella
CC   sp. or Yersinia enterocolitica . The chip is useful for detecting
CC   clinically relevant bacteria. The chip enables determination of one or
CC   more different bacterial 16S-rRNA in a liquid sample, simultaneously and
CC   enables rapid, accurate, easy and reliable identification of bacteria by
CC   genotypic characterization in a provided sample and also enables
CC   identification of a bacterium even in a complex biological sample. The
CC   chip which is produced at reduced cost, enables determination of 16S-rRNA
CC   in a sample with reduced experimental error and variation. The present
CC   sequence represents a probe of the invention used as an analytical chip.

PT   Analytical chip useful for simultaneous determination of one or more
PT   different bacterial 16S-rRNA in liquid sample, comprising evanescent
PT   field measurement platform as solid carrier and several specific
PT   recognition elements.
XX
PS   Claim 1; SEQ ID NO 286; 82pp; English.
XX
CC   The present invention relates to an analytical chip for simultaneous
CC   determination of one or more different bacterial 16S-rRNA in liquid
CC   sample. The chip is useful for detecting one or more bacterial 16S-rRNA,
CC   derived from bacteria such as Achromobacter xylosoxidans , Acinetobacter
CC   baumannii , Actinomyces israelii , Aerococcus viridans , Aeromonas
CC   hydrophilia , Agrobacterium radiobacter , Bacillus sp. , Bacteroides
CC   ovatus , Campylobacter fetus , Citrobacter freundii , Enterococcus avium
CC   , Eubacterium lentum , Escherichia coli , Flavobacterium breve ,
CC   Fusobacterium nucleatum , Gemella morbillorum , Gardnerella vaginalis ,
CC   Haemophilus influenzae , Hafnia alvei , Kingella sp. , Klebsiella oxytoca
CC   , Lactobacillus acidophilus , Legionella pneumophila , Moraxella
CC   catarrhalis , Mycobacterium avium , Neisseria cinerea , Nocardia sp. ,
CC   Ochrobactrum anthropi , Pasteurella multocida , Peptostreptococcus magnus
CC   , Salmonella typhi , Shigella sonnei , Veillonella parvula , Veillonella
CC   sp. or Yersinia enterocolitica . The chip is useful for detecting
CC   clinically relevant bacteria. The chip enables determination of one or
CC   more different bacterial 16S-rRNA in a liquid sample, simultaneously and
CC   enables rapid, accurate, easy and reliable identification of bacteria by
CC   genotypic characterization in a provided sample and also enables
CC   identification of a bacterium even in a complex biological sample. The
CC   chip which is produced at reduced cost, enables determination of 16S-rRNA
CC   in a sample with reduced experimental error and variation. The present
CC   sequence represents a probe of the invention used as an analytical chip.

PT   Single-stranded DNA for identifying gene signatures - isolated from 3'-
PT   directed human cDNA library that reflects relative abundance of corresp.
PT   mRNA in specific human tissues.
XX
PS   Example 7; Fig 10; 2245pp; Japanese.
XX
CC   Primers T41001-T41382 are derived from novel human gene signature (GS)
CC   sequences which did not match with sequences deposited in Genbank release
CC   76. The GS sequences (T19001-T26837) were obtained from 3'-directed cDNA
CC   libraries prepared from various human tissues; synthesis of cDNA was
CC   initiated from the 3'-end of mRNA by using poly(T) as the sole primer.
CC   Each library is constructed so as to reflect accurately the relative
CC   abundance of different mRNAs in the particular tissue from which it was
CC   derived. The appearance frequency of a given GS in a cDNA library can be
CC   determined (esp. using primers and probes derived from the GS sequences)
CC   as a means of diagnosing abnormal cell function or for recognising
CC   different cell types. The primers T41311-2 amplify clone pm2049 which
CC   comprises the GS HUMGS001057 (T20057). This amplification reaction gave a
CC   prod. indistinguisable from the same PCR using Chinese hamster ovary DNA
CC   as a template

PT   New antisense oligonucleotides - for modulation of human B-raf gene
PT   expression.
XX
PS   Claim 7; Page 22; 72pp; English.
XX
CC   This sequence represents an example of an antisense oligonucleotide of
CC   the invention. The oligonucleotides are 8-50 nucleotides in length, and
CC   are targeted to a nucleic acid encoding human B-raf and which is capable
CC   of inhibiting human B-raf expression. The oligonucleotides is used to
CC   inhibit the (abnormal) expression of human B-raf, to inhibit
CC   hyperproliferation of cells, to treat or prevent an abnormal
CC   proliferative condition, e.g. hyperproliferative disorders such as cancer
CC   (e.g. of the brain or nervous system), restenosis, psoriasis or a
CC   disorder characterised by T-cell activation and growth. They may also be
CC   used to diagnose these diseases, as well as atherosclerosis. The
CC   oligonucleotides of the invention may be used to distinguish raf-
CC   associated tumours from tumours having other etiologies. The antisense
CC   oligonucleotides can also be used to quantify raf expression in assays

PT Predicting susceptibility to HIV infection or progression useful for
PT selection of therapeutic treatment for persons infected with HIV virus,
PT comprises detecting polymorphism in human interleukin-10 promoter.
XX
PS Example 1; Page 11; 40pp; English.
XX
CC The present invention describes a method for predicting susceptibility to
CC HIV infection or HIV progression in a subject. The method involves
CC detecting a polymorphism in a human interleukin-10 (IL-10) promoter,
CC where the presence of the polymorphism indicates susceptibility to HIV
CC infection or HIV progression. The method provides prognostic information
CC to persons infected with HIV virus and is useful to help select
CC treatments (such as administration of IL-10 or gene therapy with IL-10).
CC The presence of polymorphism is useful as predictor that very aggressive
CC treatment could substantially eradicate the virus from the infected
CC person. The method is useful for the generation of normograms or other
CC predictive algorithms that can be used, in association with allele
CC status, to prognose probable survival or years to development of AIDS
CC following HIV seroconversion. It indicates that increased expression of
CC the IL-10 gene helps to reduce HIV-1 infection and pathogenic progression
CC and enables a variety of new therapeutic interventions in the treatment
CC of HIV disease. The present sequence represents a short tandem repeat
CC (STR) primer which is used in an example from the present invention

PT Treating cancer, angiogenesis or neovascularization by administering
PT antisense oligonucleotides targeted to human raf sequences.
XX
PS Example 18; Col 26; 41pp; English.
XX
CC The present invention relates to novel antisense oligonucleotides which
CC are targetted to nucleic acids encoding human raf proteins and capable of
CC inhibiting raf expression. The invention also relates to methods of
CC inhibiting hyperproliferation of cells which involves contacting the
CC hyperproliferating cells with a therapeutically effective amount of an

```
CC   oligonucleotide of the invention. The method is useful for treating
CC   cancer, angiogenesis or neovascularisation, especially ocular
CC   angiogenesis or neovascularisation. The present DNA sequence is an
CC   antisense oligonucleotide targetted to human B-raf kinase

PT   New antisense oligonucleotides targeted to a nucleic acid encoding acyl
PT   coenzyme A cholesterol acyltransferase-1, useful for treating a
PT   disease/condition involving abnormal lipid or cholesterol metabolism,
PT   e.g. atherosclerosis.
XX
PS   Claim 3; Page 91; 117pp; English.
XX
CC   Sequences ABZ74897-ABZ74942 represent antisense oligonucleotides targeted
CC   to the human or murine acyl coenzyme A cholesterol acyltransferase-1
CC   gene, which inhibit its expression. The antisense oligonucleotides were
CC   designed to target different regions of the human or murine acyl coenzyme
CC   A cholesterol acyltransferase-1 RNA, and were analysed for their effect
CC   on acyl coenzyme A cholesterol acyltransferase-1 mRNA levels by
CC   quantitative real-time PCR. Acyl coenzyme A cholesterol acyltransferase
CC   (ACAT) enzymes catalyse the synthesis of cholesterol esters from free
CC   cholesterol and fatty acyl-CoA, and are also involved in regulating the
CC   concentration of cellular free sterols. The human acyl coenzyme A
CC   cholesterol acyltransferase-1 is the predominant ACAT isoform in the
CC   liver, and the gene encoding it is located on chromosome 1q25, although a
CC   subsequent study has indicated that one acyl coenzyme A cholesterol
CC   acyltransferase-1 mRNA is produced from genes on two different
CC   chromosomes (chromosomes 1 and 7) by a novel RNA recombination mechanism
CC   involving trans-splicing of the two discontinuous precursor mRNAs. The
CC   oligonucleotides of the invention are useful for the prevention and
CC   treatment of conditions associated with acyl coenzyme A cholesterol
CC   acyltransferase-1, such as disorders involving abnormal lipid or
CC   cholesterol metabolism, e.g., atherosclerosis or cardiovascular disease.
CC   They are also useful in research and diagnostics for modulating the
CC   expression of acyl coenzyme A cholesterol acyltransferase-1

XX
PS Example 18; SEQ ID NO 99; 41pp; English.
XX
CC The invention describes a method of preventing or treating tumour
CC metastasis in an animal comprising administering to the animal an
CC oligonucleotide 8-50 nucleotides in length, which is targeted to mRNA
CC encoding human raf and capable of inhibiting raf expression. Also
CC disclosed are raf oligonucleotides, nucleic acids, proteins and
CC compositions used in the methods of the invention. The oligonucleotides
CC have cytostatic and antiarteriosclerotic properties, are useful as Raf-
CC inhibitors and in antisense-therapy. The methods and compositions of the
CC present invention are useful for preventing and/or treating conditions
CC associated with raf expression, such as hyperproliferative disorders,
CC atherosclerosis and tumours. This sequence represents a human b-raf
CC kinase antisense oligonucleotide.

PT   New nucleic acid sequence comprising DPP10 mRNA, useful for the
PT   manufacture of a medicament for regulating DPP10 protein expression or
PT   for preventing or treating inflammatory disease e.g., inflammatory bowel
PT   disease.
XX
PS   Disclosure; Page 321; 321pp; English.
XX
CC   The present invention describes a new isolated nucleic acid sequence (I)
CC   comprising a DPP10 mRNA sequence. DPP10 is a dipeptidyl peptidase (also
CC   known as prolyloligopeptidase). (I) has antiinflammatory, antiasthmatic,
CC   antipsoriatic, antiarthritic and antirheumatic activities, and can be
CC   used in vaccines and gene therapy. A composition comprising (I) can be
CC   used for the manufacture of a medicament for regulating DPP10 expression
CC   or for preventing or treating inflammatory disease e.g., inflammatory
CC   bowel disease, asthma, atopy, rheumatoid arthritis or psoriasis. (I) can
CC   also be used in an assay for detecting or measuring DPP10 in a sample. A
CC   host cell comprising (I) can be used for producing recombinant DPP10 gene
CC   products, or in drug screening systems to identify agents for diagnosis
CC   or treatment of individuals having or susceptible to inflammatory
CC   disease. Human DPP10 is located on chromosome 2, more specifically
CC   chromosome 2q14. ABQ84254 to ABQ84612 and ABP55569 to ABP55629 represent
CC   sequences used in the exemplification of the present invention

PT   Novel antisense oligonucleotide which is targeted to mRNA encoding human
PT   raf and which is capable of inhibiting raf expression, useful for
PT   treating or preventing hyperproliferative conditions such as cancer.
XX
PS   Example 18; Page 14; 42pp; English.
XX
CC   The invention relates to an oligonucleotide 8-50 nucleotides in length
CC   which is targeted to mRNA encoding human c-raf, a-raf or b-raf (raf is a
CC   protein kinase playing a regulatory role in signal transduction,
CC   regulating cell proliferation and has been implicated in lung carcinoma),
CC   and which is capable of inhibiting raf expression. Also included is a
CC   composition comprising the oligonucleotide and a pharmaceutically
CC   acceptable carrier. The antisense oligonucleotide is useful for
CC   inhibiting the expression of human raf in human cells or tissues, by
CC   contacting the human cells or tissues with the oligo. The oligo. is also
CC   is useful for treating or preventing a disease or condition associated
CC   with the expression of raf by administering it in combination with a
CC   chemotherapeutic agent to a human or cells of the human, where the
CC   expression of raf is abnormal expression, and the condition is a
CC   hyperproliferative condition such as cancer, angiogenesis or
CC   neovascularisation (preferably ocular angiogenesis or
CC   neovascularisation). The oligo. is also useful for inhibiting
CC   hyperproliferation of cells. The oligos. are also useful as tools, for
CC   example for detecting and determining the role of raf expression in
CC   various cell functions and physiological processes and conditions and for
CC   diagnosing conditions associated with raf expression and for research
CC   purposes. The present sequence is an antisense oligonucleotide targeting

PT   oligonucleotide containing less percentage of adenosine, targeted to
PT   nucleic acids associated with lung airway or lung dysfunction, and
PT   bronchodilating agent.
XX
PS   Claim 15; SEQ ID NO 1344; 763pp; English.
XX
CC   This invention describes a novel composition (a) a first active agent,
CC   comprising oligonucleotides, effective for alleviating
CC   bronchoconstriction, respiratory tract inflammation, allergies and
CC   reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,
CC   surfactant depletion or hyposecretion, when administered to a mammal. The
CC   oligonucleotides are derived from a gene encoding or regulating
CC   expression of a target polypeptide associated with lung airway or lung
CC   dysfunction or cancer and can be anti-sense to the corresponding mRNA.
CC   The invention also describes a kit, that comprises: (a) a delivery
CC   device, in separate containers, (b) the oligonucleotides, (c)
CC   instructions for adding a carrier and for use of the kit. The composition
CC   of the invention has antiallergic, antiinflammatory, antiasthmatic,
CC   analgesic, hypotensive, immunosuppressive and cytostatic activity, is a
CC   beta-adrenergic agonist. The composition is useful for preventing or
CC   treating a respiratory, lung or malignant disease. The administered
CC   composition comprises oligo and is administered to reduce the production
CC   or availability, or to increase the degradation of the target mRNA or to
CC   reduce the amount of target polypeptide present in the lungs. The
CC   pulmonary obstruction, and/or bronchoconstriction and/or lung
CC   inflammation, allergies and/or surfactant hypoproduction are associated
CC   with a disease or condition such as pulmonary vasoconstriction,
CC   inflammation, allergies, asthma, impeded respiration, respiratory
CC   distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary
CC   hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary
CC   transplantation rejection, pulmonary infections, bronchitis or cancer.
CC   The reduced adenosine content of the anti-sense oligos corresponding to
CC   thymidines present in the target RNA serves to prevent the breakdown of
CC   the oligonucleotides into products that free adenosine into the system
CC   e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to
CC   prevent any unwanted effects due to it

XX
PT Pharmaceutical composition for treating asthma, has antisense
PT oligonucleotide containing less percentage of adenosine, targeted to
PT nucleic acids associated with lung airway or lung dysfunction, and
PT bronchodilating agent.
XX
PS Claim 15; SEQ ID NO 5276; 763pp; English.
XX
CC This invention describes a novel composition (a) a first active agent,
CC comprising oligonucleotides, effective for alleviating
CC bronchoconstriction, respiratory tract inflammation, allergies and
CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,
CC surfactant depletion or hyposecretion, when administered to a mammal. The
CC oligonucleotides are derived from a gene encoding or regulating
CC expression of a target polypeptide associated with lung airway or lung
CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.
CC The invention also describes a kit, that comprises: (a) a delivery
CC device, in separate containers, (b) the oligonucleotides, (c)
CC instructions for adding a carrier and for use of the kit. The composition
CC of the invention has antiallergic, antiinflammatory, antiasthmatic,
CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a
CC beta-adrenergic agonist. The composition is useful for preventing or
CC treating a respiratory, lung or malignant disease. The administered
CC composition comprises oligo and is administered to reduce the production
CC or availability, or to increase the degradation of the target mRNA or to
CC reduce the amount of target polypeptide present in the lungs. The
CC pulmonary obstruction, and/or bronchoconstriction and/or lung
CC inflammation, allergies and/or surfactant hypoproduction are associated
CC with a disease or condition such as pulmonary vasoconstriction,
CC inflammation, allergies, asthma, impeded respiration, respiratory
CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary
CC hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary
CC transplantation rejection, pulmonary infections, bronchitis or cancer.
CC The reduced adenosine content of the anti-sense oligos corresponding to
CC thymidines present in the target RNA serves to prevent the breakdown of
CC the oligonucleotides into products that free adenosine into the system
CC e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to
CC prevent any unwanted effects due to it

PT   New antisense oligonucleotide, comprising a sequence targeted to a
PT   nucleic acid encoding protein tyrosine phosphatase type IVA member 3 (PRL
PT   -3), useful for preparing a composition for treating hyperproliferative
PT   disorders, e.g., cancer.
XX
PS   Example 15; SEQ ID NO 75; 77pp; English.
XX
CC   The invention relates to a compound comprising a sequence comprising 8-80
CC   base pairs (bp) targeted to a nucleic acid encoding protein tyrosine
CC   phosphatase type IVA member 3 (PRL-3), that specifically hybridises with
CC   the nucleic acid encoding PRL-3 and inhibits expression of PRL-3, i.e. is
CC   an antisense oligonucleotide (AO). Also included are a composition
CC   comprising the compound and a carrier or diluent, inhibiting the
CC   expression of PRL-3 in cells or tissues, treating an animal having or
CC   suspected of having a disease or condition associated with PRL-3 and
CC   screening for an antisense compound. The antisense oligonucleotide is
CC   useful for preparing a composition for treating hyperproliferative
CC   disorder, particularly cancer ((e.g. colorectal cancer), diabetes,
CC   reduced glucose tolerance, insulin resistance and obesity. The present
CC   sequence is an antisense oligonucleotide targeting human PRL3.

PT   Novel single or multiple target oligonucleotide anti-sense to e.g.
PT   initiation codons and introns of respiratory disease-relevant genes e.g.,
PT   CCR1, RANTES, MCP4, useful for prophylaxis or treating respiratory
PT   disease e.g., asthma.
XX
PS   Claim 2; SEQ ID NO 769; 85pp; English.
XX
CC   The present invention relates to an oligonucleotide anti-sense to e.g.,
CC   initiation codon, coding region with 2-10 nucleotides of 5'-end and 3'-
CC   end of nucleic acid target comprising gene(s) chosen from e.g.
CC   interleukin (IL)-4 receptor, IL-5 receptor or salts of the
CC   oligonucleotide and optionally surfactant operatively linked to the
CC   oligonucleotide. The method is useful for preventing or treating a
CC   respiratory or lung disease, which involves administering to the airways
CC   of a subject an effective amount of an inhibitor. The oligonucleotide is
CC   useful for production of a medicament for the prevention and/or treatment
CC   of a respiratory or lung disease. The respiratory or lung disease is
CC   chosen from airway inflammation, allergy(ies), asthma, impeded
CC   respiration, cystic fibrosis (CF), chronic obstructive pulmonary diseases
CC   (COPD), allergic rhinitis (AR), acute respiratory distress syndrome
CC   (ARDS), pulmonary hypertension, lung inflammation, bronchitis, airway
CC   obstruction. The present sequence represents an oligonucleotide of the
CC   invention.

PT   Novel single or multiple target oligonucleotide anti-sense to e.g.
PT   initiation codons and introns of respiratory disease-relevant genes e.g.,
PT   CCR1, RANTES, MCP4, useful for prophylaxis or treating respiratory
PT   disease e.g., asthma.
XX
PS   Claim 2; SEQ ID NO 820; 85pp; English.
XX
CC   The present invention relates to an oligonucleotide anti-sense to e.g.,
CC   initiation codon, coding region with 2-10 nucleotides of 5'-end and 3'-
CC   end of nucleic acid target comprising gene(s) chosen from e.g.
CC   interleukin (IL)-4 receptor, IL-5 receptor or salts of the
CC   oligonucleotide and optionally surfactant operatively linked to the
CC   oligonucleotide. The method is useful for preventing or treating a
CC   respiratory or lung disease, which involves administering to the airways
CC   of a subject an effective amount of an inhibitor. The oligonucleotide is
CC   useful for production of a medicament for the prevention and/or treatment
CC   of a respiratory or lung disease. The respiratory or lung disease is
CC   chosen from airway inflammation, allergy(ies), asthma, impeded
CC   respiration, cystic fibrosis (CF), chronic obstructive pulmonary diseases
CC   (COPD), allergic rhinitis (AR), acute respiratory distress syndrome
CC   (ARDS), pulmonary hypertension, lung inflammation, bronchitis, airway
CC   obstruction. The present sequence represents an oligonucleotide of the
CC   invention.

PT   New antisense oligonucleotides targeted to a nucleic acid encoding liver
PT   related homologue-1 (LRH1), useful for treating breast cancer,
PT   dyslipidemia, atherosclerosis, hypercholesterolemia, or hepatitis.
XX
PS   Example 15; SEQ ID NO 2038; 909pp; English.
XX
CC   This invention relates to novel antisense compounds useful for modulating
CC   the expression of liver related homologue-1 (LRH1) and splice variants
CC   thereof. Specifically, it refers to compositions 8-30 nucleobases in
CC   length that target a portion of an active site on the nucleic acid
CC   molecule encoding LRH1 (also known as NR5A2). LRH1 is a monomeric orphan
CC   nuclear receptor protein that functions as a tissue specific
CC   transcription factor. The present invention describes antisense
CC   oligonucleotides that comprise at least one modified internucleoside
CC   linkage, a phosphorothioate linkage; at least one modified sugar moiety,
CC   a 2'-O-methoxyethyl (2' MOE) and at least one modified nucleobase, a 5-
CC   methylcytidine. These antisense compounds are useful for treating or
CC   diagnosing a disease associated with LRH1, such as breast cancer,
CC   dyslipidaemia, atherosclerosis, low HDL (high density lipoprotein), high
CC   LDL (low density lipoprotein), hypercholesterolaemia, gall stones,
CC   triglyceridaemia, obesity, hepatitis B virus-mediated acute or chronic
CC   hepatitis, as well as hepatocellular carcinoma or a condition associated
CC   with aromatase activity. Accordingly, these compositions exhibit
CC   cytostatic, antilipaemic, antiarteriosclerotic, anorectic, hepatotropic,
CC   litholytic, antiinflammatory and virucidal activities. This
CC   oligonucleotide sequence is an antisense DNA oligo used to modulate the
CC   expression of the human LRH1 protein of the invention.

PT   New antisense compound, having a sequence targeted to a nucleic acid
PT   encoding endothelial specific molecule-1 (ESM-1), useful for preparing a
PT   composition for treating e.g., diabetes, cancer or cardiovascular
PT   disorder.
XX
PS   Claim 3; SEQ ID NO 887; 555pp; English.
XX
CC   The invention describes a new antisense compound, having a sequence
CC   comprising 8-30 bp targeted to a nucleic acid encoding endothelial
CC   specific molecule-1 (ESM-1), that specifically hybridises with the
CC   nucleic acid ESM-1 and inhibits its expression. Also described are: a
CC   composition; inhibiting the expression of ESM-1 in cells or tissues; and
CC   treating an animal having a disease or condition associated with ESM-1.
CC   The compound is useful for preparing a composition for treating diabetes,
CC   cancer, ischaemia or reperfusion injury, or angiogenic, immunological,
CC   cardiovascular or neurological disorder. This sequence represents an
CC   antisense oligonucleotide that can be used to modulate expression of
CC   endothelial specific molecule-1 (ESM-1).

PS   Claim 2; SEQ ID NO 820; 174pp; English.
XX
CC   The invention relates to oligonucleotides anti-sense to an initiation
CC   codon, coding region, 5' or 3' intron-exon junction, intron or region
CC   with 2-10 nucleotides of the 5'-end or 3'-end of a nucleic acid target
CC   chosen from a gene encoding interleukin (IL)-4 receptor, interleukin (IL)
CC   -5 receptor, CCR1, CCR3, Eotaxin-1, RANTES, MCP4, CD23, ICAM, VCAM,
CC   tryptase a, tryptase b, PDE4 A, PDE4 B, PDE4 C or PDE4 D. The invention
CC   also relates to a method of screening a candidate compound that binds to
CC   one or more nucleic acid target(s) or expressed product(s), for the
CC   prevention and/or treatment of a respiratory or lung disease. The
CC   oligonucleotides are useful for reducing or inhibiting expression of a
CC   gene or mRNA encoding interleukin-4 receptor, interleukin-5 receptor,
CC   CCR1, CCR3, Eotaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a,
CC   tryptase b, PDE4 A, PDE4 B, PDE4 C, or PDE4 D. The oligonucleotides are
CC   useful for preventing or treating a respiratory or lung disease. The
CC   respiratory or lung disease is associated with hyper-responsiveness to
CC   and/or increased levels of, adenosine and/or levels of adenosine A
CC   receptor(s), and/or asthma and/or lung allergies associated with
CC   inflammation or an inflammatory disease. The respiratory or lung disease
CC   is chosen from airway inflammation, allergy, asthma, impeded respiration,
CC   cystic fibrosis (CF), chronic obstructive pulmonary disease (COPD),
CC   allergic rhinitis, acute respiratory distress syndrome, pulmonary
CC   hypertension, lung inflammation, bronchitis, airway obstruction or
CC   bronchoconstriction. This sequence represents an oligonucleotide of the
CC   invention.

PT e.g. diabetes, immunological disorders, cardiovascular disorders,
PT gallstones or obesity.
XX
PS Claim 4; SEQ ID NO 403; 150pp; English.
XX
CC The invention relates to an antisense compound 8-30 nucleobases in length
CC targeted to a nucleic acid molecule encoding Farnesoid X receptor (FXR),
CC where the antisense compound specifically hybridizes with and inhibits
CC the expression of FXR. The composition and methods are useful for
CC inhibiting the expression of FXR (Farnesoid X receptor) in cells or
CC tissues, or for treating diseases or conditions associated with FXR, such
CC as diabetes, immunological disorders, cardiovascular disorders, e.g.
CC dyslipidemia and its symptoms, atherosclerosis, low HDL (high density
CC lipoprotein), elevated LDL (low density lipoprotein) or
CC hypercholesterolemia, gallstones, hypertriglyceridemia, obesity,
CC neurological disorders, or ischemia/reperfusion injury. In addition, the
CC composition is used for diagnostics, prophylaxis, or as research reagents
CC or kits. This sequence corresponds to an antisense oligonucleotide of the
CC invention.

PT   DNA encoding maize di:hydro:di:picolinic acid synthase mutant - resistant
PT   to feedback inhibition by lysine.
XX
PS   Example 7; Col 20; 35pp; English.
XX
CC   AAT42552-T42561 represent amplification primers for the recombinant DNA
CC   sequence used in the method of the invention. The method of the invention
CC   is for increasing the level of L-Lysine in a plant. In the method, a
CC   recombinant DNA sequence is introduced into the cells of a plant tissue
CC   source. The recombinant sequence comprises an altered mature Zea mays
CC   dihydrodipicolinic acid (DHPS) sequence (see AAT42547) which is
CC   substantially resistant to feedback inhibition by endogenously produced
CC   free L-Lysine, and a second sequence which encodes a chloroplast transit
CC   sequence (see AAT42549). The DHPS used has at least one amino acid
CC   alteration contained within residues 100-125, and is more than 400 times
CC   less sensitive to lysine than wild-type DHPS. The chloroplast transit
CC   sequence localises the altered mature DHPS in the chloroplasts of the
CC   plant cells. The transfected plant cells are then used to generate plants
CC   expressing the recombinant DNA in their cells. The plants regenerated
CC   from the transformed cells have increased levels of free L-Lysine, which
CC   improves their nutritional value. The plants which can be improved by
CC   this transformation include maize and other grain crops, forage plants
CC   (such as clover, fescue, and alfalfa), and processed plants (such as
CC   tomatoes, soyabeans and lupins). The plants can be used directly as feed
CC   or food, or the L-Lysine can be extracted for use as a feed or food
CC   additive

PT   Methylated CpG island amplification (MCA) used to determine DNA
PT   methylation status of CpG sites in a given locus, useful for diagnosis of
PT   age-related disorders e.g. colon cancer and dementia.
XX
PS   Example 8; Page 69; 100pp; English.
XX
CC   The patent discloses a method known as Methylated CpG island (CGI)
CC   Amplification (MCA) to identify methylated CpG sites (cytosine residues
CC   5' of neighbouring guanine). The method uses a methylation-sensitive
CC   restriction endonuclease SmaI, that cleaves unmethylated CpG sites and
CC   its isoschizomer XmaI, that cleaves both methylated and unmethylated
CC   CGIs. It involves amplification of closely spaced methylated SmaI sites.
CC   This method is used to determine the DNA methylation status of CpG sites
CC   in a given locus, in normal and neoplastic cells. It can be used for
CC   diagnosis of age-related disorders, associated with methylation of CGIs,
CC   e.g. dementia, artherosclerosis and diabetes mellitus, cell proliferative
CC   disorders, e.g. cancer of the kidney, colon, breast, uterus, prostate and
CC   lung, leukaemia, glioblastoma, astrocytoma and neuroblastoma. It is also
CC   used to evaluate the cell response to a methylation modulating agent. It
CC   can also be used to screen samples for the presence of hypermethylation
CC   of specific genes. The present DNA sequence is the human MINT1 clone
CC   (Methylated IN Tumour) specific PCR primer-1, used for amplification and
CC   bisulphite-restriction methylation analysis

PT   Nucleic acids comprising single nucleotide polymorphisms, useful in
PT   applications such as forensics, paternity testing, medicine, genetic
PT   analysis and phenotype correlations to diseases such as diabetes and
PT   atherosclerosis.
XX
PS   Example; Page 126; 242pp; English.
XX
CC   The present invention provides a method of diagnosing a vascular disease
CC   in an individual, involving determining the sequence at various
CC   polymorphic sites within the human thrombospondin 1 and thrombospondin 4
CC   genes. The sequences at a number of polymorphic sites are also provided
CC   in the specification. In particular, the method can be used in the
CC   diagnosis of atherosclerosis, myocardial infarction, coronary heart
CC   disease, stroke, peripheral vascular diseases, venous thromboembolism and
CC   pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also
CC   useful in forensics, paternity testing, genetic analysis and phenotype
CC   correlations to diseases. The present sequence is an example of one of
CC   the human gene SNPS shown in the specification

PT   In vitro production of T cells, useful for treating immune disorders e.g.
PT   AIDS, lymphoma and DiGeorge's Syndrome, involves culturing a lymph node
PT   cell in vitro with a primate hematopoietic T cell progenitor cell.
XX
PS   Example 6; Page 22; 41pp; English.
XX
CC   This invention relates to a method for the in vitro production of T
CC   cells. The T cells are generated from a population of haematopoietic T
CC   cell progenitor cells. One example comprises culturing a lymph node cell
CC   in vitro with a primate haematopoietic T-cell progenitor cell. The method
CC   is useful for modifying a haematopoietic stem cell to produce a
CC   descendent cell containing a nucleotide sequence of interest. This
CC   comprises contacting the primate hematopoietic T cell progenitor cell and
CC   the lymph node cells with an expression vector such as a viral vector,
CC   comprising a nucleotide sequence of interest, so as to allow the virus to
CC   enter the haematopoietic T cell progenitor cell. The method is also
CC   useful for treating a subject having an immune disorder such as an
CC   immunodeficiency or immunoproliferative disorder, further comprising
CC   administering the progenitor cell or its descendent to the subject.
CC   Factors such as cytokines are also administered to the lymph node in the
CC   subject. The method is useful for treating immune disorders such as AIDS,
CC   DiGeorge's Syndrome (Complete Athymia), and immunoproliferative disorders
CC   such as lymphoma. Haematopoietic T cells produced by the method and their
CC   progeny are used as carriers for the production of a wide variety of
CC   products where the host cell is genetically deficient or as a result of
CC   subsequent diseases as become genetically deficient. The present sequence
CC   represents a PCR primer used to amplify cDNA in a pTalpha assay. The
CC   assay is used to determine the presence or absence of immature T cells,
CC   in an example illustrating the method of the invention

CC   The present invention relates to novel methods for constructing fungal
CC   strains useful for identification and validation of gene products as
CC   targets for therapeutic agents, for creating a collection of identified
CC   essential genes, and screening assays for the discovery of new drugs. The
CC   invention provides the GRACE (gene replacement and conditional
CC   expression) method for the construction of mutant organisms referred to
CC   as GRACE strains of the organism. The invention can be applied to any
CC   organism, particularly a pathogenic fungus e.g. Candida albicans,
CC   Aspergillus fumigatus and Cryptococcus neoformans. The methods are useful
CC   to identify agents that may be used in the treatment of fungal
CC   infections. AAS23687-AAS23747 represent primers A #1-61 used as probes
CC   for identifying C. albicans GRACE strains

PT   New alpha catenin polypeptides and polynucleotides encoding them, useful
PT   for predicting, diagnosing or treating cadherin-catenin related diseases,
PT   particularly cardiomyopathies, cancer and male infertility.
XX
PS   Example; Page 35; 132pp; English.
XX
CC   The invention relates to human and mouse alpha-catenin polypeptides and
CC   their associated polynucleotides. The polypeptides and related antibodies
CC   are useful for modulating the cadherin-catenin related pathway in
CC   selected organs, such as the heart and testis. The nucleic acids and the
CC   antibodies are useful in the diagnosis and/or prediction of the
CC   likelihood of developing cadherin-catenin related diseases. The nucleic
CC   acids may also be used to predict the likelihood of developing cancer or
CC   in diagnosing cancer, and in gene therapy. The polypeptide, the nucleic
CC   acid or the antibody is useful in manufacturing a medicament for treating
CC   cadherin-catenin related diseases, such as cancer, cardiomyopathy,
CC   specifically dilated cardiomyopathy, and male infertility. Sequences
CC   ABK41510-ABK41599 represent PCR primers used to amplify DNA encoding
CC   human and mouse alpha-catenin polypeptides, including the CTNNA3 gene
CC   which encodes human alpha T-catenin

PT   Constructing strains for identifying gene products as effective targets
PT   for therapeutic intervention, by inactivating in the strain one allele of
PT   a gene and placing other allele of the gene under conditional expression.
XX
PS   Claim 36; SEQ ID NO 4086; 167pp + Sequence Listing; English.
XX
CC   The invention relates to constructing (M1) a strain of diploid fungal
CC   cells in which both alleles of a gene are modified, comprising modifying
CC   one allele by insertion or replacement by a cassette having an
CC   expressible selectable marker and modifying other allele by
CC   recombination, of a promoter replacement fragment with a heterologous
CC   promoter, so that expression of the second allele is regulated by the
CC   promoter. (M1) is useful for constructing a strain of diploid fungal
CC   cells in which both alleles of a gene are modified. The diploid fungal
CC   cells having both alleles modified are useful for identifying a gene that
CC   is essential to the survival or growth of a fungus, a gene that
CC   contributes to the virulence and/or pathogenicity of a fungus, a gene
CC   that contributes to the resistance of a diploid fungus to an antifungal
CC   agent, an antifungal agent that inhibits the growth of a diploid fungus
CC   and for identifying a therapeutic agent for treatment of a mammalian
CC   disease. (M1) is useful for identifying a compound which modulates the
CC   activity of a gene product, preferably enzymatic activity, carbon
CC   compound catabolism, biosynthetic, transporter, transcriptional,
CC   translational, signal transduction, DNA replication and cell division
CC   activity. The method is useful for identifying a compound having the
CC   ability to inhibit growth or proliferation of C. albicans cells and for
CC   treating infection by C. albicans. The present sequence is that of a PCR
CC   primer used in the method of the invention. Note: The sequence data for
CC   this patent is not represented in the printed specification but is based
CC   on sequence information supplied to Derwent by the European Patent Office

PT   Identifying increased risk of developing cancer in subject, involves
PT   analyzing first biological sample from subject for loss of imprinting of
PT   IGF2 gene, indicative of increased risk of developing cancer in subject.
XX
PS   Claim 9; SEQ ID NO 3; 19pp; English.
XX
CC   The present invention relates to a method for identifying an increased
CC   risk of developing cancer in a subject. The method involves analysing a
CC   first biological sample from the subject for loss of imprinting of the
CC   insulin-like growth factor 2 (IGF2) gene, where a loss of imprinting is
CC   indicative of an increased risk of developing cancer. The method includes
CC   analysing genomic DNA for altered methylation of the IGF2 gene. The
CC   altered methylation includes hypomethylation of a differentially
CC   methylated region (DMR) of IGF2. The method is useful for managing the
CC   health of a subject having a hyperproliferative disorder such as cancer,
CC   particularly colorectal cancer. The present sequence represents a PCR
CC   primer for amplifying the DMR of the human IGF2 gene.

PT Identifying loss of imprinting of the IGF2 gene to determine increased
PT risk of developing cancer comprises analyzing biological sample from the
PT subject for hypomethylation of a differentially methylated region (DMR)
PT of the H19 or IGF2 gene.
XX
PS Claim 9; SEQ ID NO 3; 122pp; English.
XX
CC The present invention describes a method for identifying loss of
CC imprinting of the IGF2 gene in a subject. The method comprises analysing
CC a biological sample from the subject for hypomethylation of a
CC differentially methylated region (DMR) of at least one of the H19 gene
CC and the IGF2 gene. Also described: (1) identifying an increased risk of
CC developing cancer in a human subject; and (2) a kit for determining a
CC methylation status of a differentially methylated region (DMR) of IGF2 or
CC H19 comprising the primer pair. The method is useful for identifying loss
CC of imprinting of the IGF2 gene to determine an increased risk of
CC developing cancer in a subject. The present sequence represents a PCR
CC primer for the DMR of the human IGF2 gene, which is used in the
CC exemplification of the present invention.

PT Novel short interfering RNA (siRNA) comprises sense and antisense RNA
PT strands, useful for inhibiting expression of human vascular endothelial
PT growth factor mRNA, for treating angiogenic disease, e.g. diabetic
PT retinopathy and cancer.
XX
PS Disclosure; SEQ ID NO 436; 218pp; English.
XX
CC This invention relates to novel compositions that comprise short
CC interfering RNA (siRNA) molecules, which can be used to inhibit
CC angiogenesis. Specifically, it refers to siRNAs that target and cause
CC RNAi-induced degradation of mRNA from human vascular endothelial growth
CC factor (VEGF), the VEGF receptor (Flt-1) and the Flk-1/KDR (kinase domain
CC region) genes, as well as mutants derived thereof. The present invention
CC describes sense and antisense RNA strands that form an RNA duplex and
CC bind to the target mRNA, such that expression is inhibited and the target
CC degraded. As such, siRNA administered in combination with a therapeutic
CC agent is useful for treating diseases associated with angiogenesis and
CC the overexpression of VEGF, which include diabetic retinopathy, age-
CC related macular degeneration, inflammatory disease, psoriasis and
CC rheumatoid arthritis. Furthermore, it can be used to treat various
CC cancers including breast, retinoblastoma, Wilm's tumour and lymphoma.
CC Accordingly, these compositions exhibit cytostatic, antidiabetic,
CC ophthalmological, antiinflammatory, antipsoriatic, antirheumatic and
CC antiarthritic activities. This oligonucleotide is a human Flt-1 DNA
CC oligo, a target for siRNA inhibition of the invention.

CC The invention relates to the isolation of 6327 nucleotide sequences,
CC fragments of at least 15 consecutive nucleotides of these nucleotides, a
CC sequence having at least 80% identity, after optimal alignment, with the
CC nucleotides, a sequence that hybridizes under stringent conditions with
CC the nucleotides, or the complement, or corresponding RNA, of the
CC nucleotides. The nucleotides are used as probes or primers for detecting,
CC identifying, quantifying and/or amplifying nucleic acids, as in vitro
CC sense and antisense sequences, of nucleotides involved in tumour
CC suppression or reversion, apoptosis and or viral resistance, to produce
CC recombinant polypeptides, and to prepare transgenic animals, as
CC experimental models. The nucleotides (also vectors containing them and
CC cells containing the vectors), the encoded polypeptides and antibodies
CC (Ab) against the polypeptide are useful for prevention and/or treatment
CC of viral infections or diseases characterized by development of tumours
CC or cell degeneration (e.g. Alzheimer's disease or schizophrenia).
CC Analysis of the expression of the nucleotides can be used for diagnosis
CC and/or prognosis of these diseases. The nucleotides and polypeptides can
CC also be used to screen for their specific interactive molecules,
CC potentially useful for treating diseases associated with abnormal
CC expression of the nucleotides.

PT   New short interfering nucleic acid, useful e.g. for treatment and
PT   diagnosis of obesity or diabetes, downregulates expression of the
PT   stearoyl-CoA desaturase gene.
XX
PS   Example 3; SEQ ID NO 119; 139pp; English.
XX
CC   The present invention describes a short interfering nucleic acid (siNA)
CC   that downregulates expression of the SCD (stearoyl-CoA desaturase) gene
CC   by RNA interference. Also described: (1) modulating expression of SCD
CC   genes in cells, tissue explants or organisms by introduction of siNA; (2)
CC   kits for in vitro or in vivo delivery of siNA; (3) conjugates and/or
CC   complexes of siNA; and (4) vectors that express siNA. SCD inhibiting
CC   siNAs have anorectic, antidiabetic, antiarteriosclerotic, cytostatic and
CC   virucide activities. The siNAs can be used to modulate expression of SCD
CC   genes, in cells, tissue explants or organisms, e.g. for treating obesity;
CC   diabetes (types I and II); atherosclerosis; cancer and viral infections.
CC   They can also be used for drug screening; diagnosis; target
CC   identification and validation; genetic engineering; pharmacogenomics;
CC   studying gene function and gene mapping (e.g. of single-nucleotide
CC   polymorphisms). The present sequence represents an SCD siNA, which is
CC   used in the exemplification of the present invention.

PS   Example 17; Page 87; 127pp; English.
XX
CC   The present sequence for human caspase 3 antisense oligonucleotide 108954
CC   is 1 of various novel antisense oligonucleotides (AAS10517-AAS10676)
CC   described in the present invention. Also described are methods of using
CC   these compounds for the modulation of caspase 3 expression. The caspase 3
CC   antisense oligonucleotides specifically hybridise with and inhibit the
CC   expression of caspase 3. Antisense compounds targeted to caspase 3 are
CC   useful to inhibit caspase 3 expression in cells or tissues and to
CC   modulate apoptosis. The caspase 3 antisense oligonucleotides are useful
CC   for treating disorders associated with expression of caspase 3. Such
CC   disorders include hyperproliferative disorders (e.g. cancer), viral
CC   infections (e.g. hepatitis), haematopoietic disorders, autoimmune
CC   disorders, atherosclerosis and neurological disorders (e.g. Alzheimer's
CC   disease)

PT   New antisense compounds capable of modulating expression of human protein
PT   phosphatase 1B, useful for diagnosis, prophylaxis and treatment of
PT   diseases associated with expression of protein phosphatase.
XX
PS   Claim 1; Col 42; 71pp; English.
XX
CC   The invention is directed to antisense compounds, particularly
CC   oligonucleotides which are targetted to a DNA encoding protein
CC   phosphatase 1B (PTP1B) to modulate its expression. The antisense
CC   compounds are useful for diagnosis, prophylaxis and treatment of diseases
CC   associated with the expression of PTP1B, to prevent or delay infection,
CC   inflammation and tumour formation and as a research reagent. The PTP1B
CC   DNA is useful in gene therapy. The present sequence is an antisense
CC   oligonucleotide with a phosphorothioate backbone. This oligo is targetted
CC   to human PTP1B to inhibit its expression

PT   Compound for inhibiting the expression of protein phosphatase 1B (PTP1B)
PT   and for treating diabetes, cancer, or obesity, comprises an antisense
PT   oligonucleotide targeted to nucleic acid encoding PTP1B.
XX
PS   Claim 3; Page 23; 133pp; English.
XX
CC   The invention relates to a compound of 8-50 nucleobases in length
CC   targeted to a nucleic acid encoding protein phosphatase 1B (PTP1B), where
CC   the compound specifically hybridises with and inhibits the expression of
CC   PTP1B (e.g. an antisense oligonucleotide). Also included are (1) a
CC   compound of 8-50 nucleobases in length which specifically hybridises with
CC   an 8 nucleobase portion of an active site on a nucleic acid encoding
CC   PTP1B; (2) inhibiting the expression of PTP1B in cells or tissues
CC   comprising contacting the cells or tissues with the compound; treating an
CC   animal having or suspected of having a disease or condition associated
CC   with PTP1B comprising administering the compound; (4) decreasing blood
CC   sugar levels in an animal comprising administering the compound; (5)
CC   preventing or delaying the onset of a disease or condition associated
CC   with PTP1B in an animal comprising administering the compound; and (6)
CC   preventing or delaying the onset of an increase in blood glucose levels
CC   in an animal comprising administering the compound. The compound is used
CC   to inhibit the expression of PTP1B in cells or tissues, to treat or
CC   prevent or delay the onset of a disease or condition associated with
CC   PTP1B, such as type 2 diabetes, obesity, cancer (especially ovarian
CC   cancer, chronic myeloid leukaemia and hyperproliferative diseases in an
CC   animal having or suspected of having the disease or condition, and for
CC   decreasing blood sugar levels or preventing or delaying the onset of an
CC   increase in blood glucose levels in an animal. The compound is also used
CC   in diagnostics, therapeutics, prophylaxis, and in research reagents and
CC   kits. The present sequence is an antisense compound of the invention
CC   targetting human PTP1B

PT   Novel antisense compound useful for treating type 2 diabetes, cancer and
PT   obesity, is targeted to nucleic acid encoding human protein phosphatase
PT   1B, and hybridizes and inhibits PTP1B expression.
XX
PS   Claim 3; Page 67; 142pp; English.
XX
CC   The invention relates to a compound targeted to a nucleic acid molecule
CC   encoding protein phosphatase 1B (PTP1B), which specifically hybridises
CC   with and inhibits the expression of PTP1B. The compounds of the invention
CC   are useful for inhibiting the expression of PTP1B in liver, kidney or
CC   adipose cells or tissues and for treating an animal, preferably human,
CC   having a disease or condition associated with PTP1B, including metabolic
CC   diseases or conditions, e.g. type 2 diabetes and obesity, or
CC   hyperproliferative conditions such as cancer. The sequences are also
CC   useful for decreasing blood (serum or plasma) glucose levels in an animal
CC   e.g. a diabetic human or rodent, for preventing or delaying the onset of
CC   a disease or condition associated with PTP1B , and for preventing or
CC   delaying the onset of an increase in blood glucose levels. This sequence
CC   represents a PTP1B mRNA level inhibition antisense oligonucleotide of the
CC   invention

PT   A composition for amplifying and/or detecting nucleic acids comprises a
PT   template nucleic acid molecule comprising a target nucleic acid sequence,
PT   a primer, a nucleotide polymerase enzyme and an agent capable of
PT   degrading a nucleotide.
XX
PS   Disclosure; SEQ ID NO 29; 95pp; English.
XX
CC   The invention is directed to one-tube nested PCR methods which use one or
CC   more outer primers containing at least one exo-sample nucleotide and
CC   inner primers. An exo-sample nucleotide is a nucleotide, e.g.
CC   deoxyuridine, that is not generally found in substantial amounts (more
CC   than 3%) in the sample or nucleic acid molecule to be amplified. Nested
CC   amplification methods are performed in the presence of an agent, e.g.
CC   uracil DNA glycosylase, that degrades the exo-sample nucleotide-
CC   containing primers in time-course fashion during the PCR cycles. The
CC   method alleviates the major contamination issue associated with classical
CC   nested PCR, and is also more convenient and economical. The present
CC   sequence is that of glucose-6-phosphate dehydrogenase (G6PD) specific
CC   outer primer G6PDFU. This is one of a set of primers for G6PD ADF82970-
CC   ADF82973 used to illustrate the one tube nested PCR method of the
CC   invention.

PT   New antisense oligonucleotide targeted to a nucleic acid encoding KOX 1,
PT   useful for treating cancer, viral or bacterial infections or a disease
PT   involving hyperactivation of an immune response.
XX
PS   Example 15; SEQ ID NO 30; 80pp; English.
XX
CC   The present invention relates to antisense compounds targeted to a
CC   nucleic acid encoding human KOX 1 (zinc finger protein 10). The antisense
CC   compound comprises an antisense oligonucleotide that specifically
CC   hybridises with the nucleic acid and inhibits the expression of KOX 1.
CC   The antisense oligonucleotide is a chimeric oligonucleotide. The
CC   antisense oligonucleotide comprises at least one modified internucleoside
CC   linkage, preferably a phosphorothioate linkage. It also comprises at
CC   least one modified sugar moiety, preferably a 2'-O-methoxyethyl (2'-MOE)
CC   sugar moiety. The antisense oligonucleotide further comprises at least
CC   one modified nucleobase, preferably a 5-methylcytosine. The antisense
CC   oligonucleotides are useful for the treatment of diseases such as
CC   hyperproliferative disorders, e.g. cancer, viral or bacterial infections,
CC   and diseases involving hyperactivation of an immune response. The present
CC   sequence represents an antisense oligonucleotide used in the examples of
CC   the present invention.

PT   New compounds, particularly antisense oligonucleotides targeted to a
PT   nucleic acid encoding PTP1B, useful for treating a disease/condition
PT   associated with PTP1B, such as cancer, diabetes or obesity.
XX
PS   Claim 3; SEQ ID NO 32; 143pp; English.
XX
CC   This invention relates to novel compositions and methods for modulating
CC   the expression of PTP1B (also known as protein phosphatase 1B and PTPN1).
CC   Specifically, it refers to antisense compounds that can target and
CC   hybridise with a nucleic acid molecule encoding PTP1B, as well as splice
CC   variants thereof and inhibit expression accordingly. PTP1B is a tyrosine
CC   phosphatase that plays an essential regulatory role in signalling
CC   mediated by the insulin receptor and as such is useful for treating
CC   diseases such as type 2 diabetes and obesity. Furthermore, PTP1B can
CC   suppress transformation of oncogenic genes, such that compositions of
CC   this invention can also be used to treat hyperproliferative conditions
CC   including cancer. Accordingly, these compounds can be described as having
CC   cytostatic, antidiabetic and anorectic activities. This oligonucleotide
CC   sequence is an antisense DNA oligo that targets human PTP1B DNA, and
CC   which has a phosphorothioate backbone and 2'-O-methoxyethyl wings, used
CC   in an exemplification of the invention.

PT   New antisense oligonucleotides that inhibit the expression of the zinc
PT   finger transcriptional repressor KOX 1, useful for treating conditions
PT   such as cancer, and hyperactivation of an immune response.
XX
PS   Example 15; SEQ ID NO 30; 80pp; English.
XX
CC   The invention relates to a compound 8-80 nucleobases in length targeted
CC   to, and which specifically hybridises with a nucleic acid molecule
CC   encoding KOX 1 (also known as zinc finger protein 10, whose gene is
CC   located on chromosome 12q13-qter), and inhibits the expression of KOX 1,
CC   i.e. an antisense oligonucleotide. Also included are inhibiting the
CC   expression of KOX 1 in cells or tissues by contacting the cells or
CC   tissues with the compound, treating an animal having a disease or
CC   condition associated with by KOX 1 administering to the animal a
CC   therapeutic or prophylactic amount of the compound and screening an
CC   antisense compound by contacting a preferred target region of a nucleic
CC   acid molecule encoding KOX 1 with one or more candidate antisense
CC   compounds and selecting for one or more candidate antisense compounds
CC   that inhibit the expression of a nucleic acid encoding KOX 1. The
CC   compound, composition and methods are useful for treating diseases or
CC   conditions associated with KOX 1, such as hyperproliferative disorders
CC   (e.g. cancer), conditions arising from bacterial or viral infection, or
CC   conditions involving hyperactivation of an immune response. They are also
CC   useful in research and diagnostics. The present sequence is an antisense
CC   oligonucleotide targeting human KOX-1.

PT   New enzymatic nucleic acid(s) - useful for, e.g. reducing alkaloid
PT   biosynthesis or regulating flowering.
XX
PS   Claim 53; Page 53; 79pp; English.
XX
CC   The present invention describes enzymatic nucleic acid molecules with RNA
CC   -cleaving activity (e.g. ribozymes) which are capable of modulating the
CC   expression of plant genes: (i) involved in biosynthesis of alkaloids; or
CC   (ii) involved in flower formation. AAV95982 to AAV96334, and AAV96335 to
CC   AAV96354 represent potato solanidine glucosyltransferase hammerhead and
CC   hairpin ribozymes, respectively. AAV95629 to AAV95981, and AAV96355 to
CC   AAV96734 represent potato solanidine glucosyltransferase target
CC   sequences. AAV96773 to AAV97170, and AAV97171 to AAV97195 represent
CC   potato citrate synthase hammerhead and hairpin ribozymes, respectively.
CC   AAV96735 to AAV96772, and AAV97196 to AAV97220 represent potato citrate
CC   synthase target sequences. Ribozymes of the present invention can be used
CC   to inhibit the synthesis of toxic alkaloids in solanaceous plants,
CC   particularly potato but also tomato, pepper, aubergine and ditura or to
CC   inhibit flowering in potato, lettuce, spinach, cabbage, brussel sprouts,
CC   arugula, kale, collards, chard, beet, turnip, sweet potato and turf
CC   grass. Also the ribozymes can be used for RNA manipulation in the same
CC   way that restriction endonucleases are for DNA, as well as to examine
CC   genetic drift and mutations in plants and to detect specific RNA. The
CC   ribozymes can be targeted to specific genes or to consensus sequences
CC   within a family of related genes, and being catalytic need to be present
CC   at only very low concentrations

PT   Enzymatic and antisense nucleic acid inhibition of repressor genes,
PT   useful for producing e.g. granulocyte colony stimulating factor protein,
PT   interferon alpha and erythropoietin.
XX
PS   Claim 42; Page 127; 164pp; English.
XX
CC   The present invention relates to enzymatic and antisense nucleic acid
CC   molecules that act as inhibitors of the expression of repressor genes
CC   encoding the TR2 Orphan receptor, EAR3/COUP-TF-1, the GATA transcription
CC   factor gene, IRF-2 and/or the CAATT Displacement Protein (CDP).
CC   Inhibition of the repressors removes prevents inhibition (and
CC   consequently increases expression of) genes involved in the production of
CC   erythropoietin, granulocyte colony stimulating factor protein and
CC   interferon alpha

PT   New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins,
PT   or as specific biomolecule capture probes for surface-enhanced laser
PT   desorption ionization, comprises human myosin-like protein hGDMLP-1.
XX
PS   Disclosure; SEQ ID NO 7643; 214pp; English.
XX
CC   The present invention describes a human genome-derived myosin-like
CC   protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-
CC   1 can be used in gene therapy and vaccine production. The hGDMLP-1
CC   nucleic acids can be used as probes to detect, characterise and quantify
CC   hGDMLP-1 nucleic acids in samples, as amplification substrates, to
CC   provide initial substrates for the recombinant engineering of hGDMLP-1
CC   protein variants having desired phenotypic improvements, and for
CC   expressing the proteins. The hGDMLP-1 proteins or polypeptides may be
CC   used as immunogens to raise antibodies that specifically recognise hGDMLP
CC   -1 proteins, as standards in assays used to determine the concentration
CC   and/or amount specifically of hGDMLP proteins, as specific biomolecule
CC   capture probes for surface-enhanced laser desorption ionisation, as
CC   therapeutic supplement in patients having specific deficiency in hGDMLP-1
CC   production, and in vaccines or for replacement therapy. The
CC   polynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a
CC   disorder associated with the expression of hGDMLP-1, in particular heart
CC   and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.
CC   The present sequence represents an oligomer used in the screening of the
CC   hGDMLP-1 sequence in the exemplification of the present invention. N.B.
CC   The sequence data for this patent did not form part of the printed
CC   specification, but was obtained in electronic format directly from WIPO

PT   pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
XX
PS   Claim 23; SEQ ID NO 8991; 495pp; English.
XX
CC   The invention relates to nucleic acid molecules that modulate replication
CC   of the West Nile Virus (WNV). The nucleic acid molecules are useful for
CC   treating a condition related to WNV infection e.g. pancreatitis,
CC   encephalitis, myocarditis, meningitis, neurologic infection, hepatitis,
CC   liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid
CC   molecule is selected from the group of ribozymes consisting of
CC   Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The
CC   nucleic acid molecules further comprise at least five ribose residues, at
CC   least ten 2'-O-methyl modifications, phosphorothioate linkages on at
CC   least three of the 5' terminal nucleotides and a 3' end modification of a
CC   3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080
CC   are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given
CC   in the specification. The present sequence is that of a nucleic acid
CC   molecule of the invention

PT   New nucleic acid sequences associated with tumor suppression, regression,
PT   apoptosis or virus resistance are useful to diagnose and treat viral
PT   disease, development of tumor cells and cell degeneration.
XX
PS   Claim 1; Page 277; 798pp; French.
XX
CC   This sequence represents an isolated nucleic acid sequence associated
CC   with tumour suppression or regression, apoptosis or virus resistance. The
CC   invention relates to these sequences or sequences having at least 80%
CC   identity to them, and polypeptides encoded by the sequences or
CC   polypeptides having 80% identity to the polypeptide sequences. The
CC   invention is used to diagnose or treat viral disease or disease
CC   characterized by development of tumour cells or cellular degeneration

PT   New oligonucleotides for identifying olfactory receptor genes, useful in
PT   designing pleasing scents and flavors, and in diagnosing male
PT   infertility.
XX
PS   Claim 4; SEQ ID NO 67; 97pp; English.
XX
CC   The present invention describes an oligonucleotide (I) comprising a
CC   nucleic acid sequence suitable for identifying an olfactory receptor gene
CC   selected from a group comprising SEQ ID Nos. 79-104, or an allelic
CC   variant. Also described: (1) a kit for identifying an olfactory receptor
CC   gene comprising at least one oligonucleotide (I); (2) an array suitable
CC   for detecting the presence of at least one allelic variant of an
CC   olfactory receptor gene, comprising at least one oligonucleotide (I)
CC   contained in or attached to a support; (3) typing (M1) a subject
CC   according to presence or absence of allelic variants of olfactory
CC   receptor genes comprising detecting the presence or absence of at least
CC   one olfactory receptor gene in a biological sample; (4) a nucleic acid
CC   construct comprising a polynucleotide encoding an olfactory receptor
CC   gene, or an allelic variant, selected from SEQ ID Nos. 79-104, and a
CC   promoter for directing transcription; and (5) a cell comprising the
CC   nucleic acid construct. The oligonucleotide (I) can be useful in
CC   detecting olfactory receptor genes, and in typing a subject according to
CC   the presence or absence of olfactory receptor genes. The olfactory
CC   receptor gene cluster is located on human chromosome 17p13.3. The
CC   oligonucleotides (I) may also be used to detect/diagnose male
CC   infertility, specifically that associated with reduced sperm motility or
CC   to detect specific odorants that may enhance or suppress sperm motility.
CC   The present sequence represents a specifically claimed oligonucleotide
CC   used in the identification of an olfactory receptor gene, which is used
CC   in the exemplification of the present invention.

PT   Use of a prostate cancer associated gene and biallelic markers derived
PT   from it.
XX
PS   Example 6; Fig 6A; 385pp; English.
XX
CC   The invention relates to a mammalian PG1 gene and protein, and a set of
CC   PG1 biallelic markers. The PG1 polynucleotide and biallelic markers are
CC   used in a hybridisation assay, a sequencing assay, or in an allele-
CC   specific amplification assay for determining the identity of a nucleotide
CC   at a PG1-related biallelic marker. The methods can be used to detect and
CC   to assess the risk of developing cancer or prostate cancer. Early-stage
CC   diagnosis of prostate cancer relies on prostate specific antigen (PSA)
CC   dosage. However, the effectiveness of this is limited due to its
CC   inability to discriminate between malignant and non-malignant affections
CC   of the organ. A need exists for both a reliable diagnostic procedure
CC   which would enable early-stage diagnosis, and for preventative and
CC   curative treatments of the disease. The PG1 gene can be used for
```

PT Treating proliferative skin or eye diseases and scarring, using ribozymes
PT that cleave RNA encoding cytokines involved in inflammation, matrix
PT metalloproteinases, growth factors and cell-cycle dependent kinases.
XX
PS Example 1; Page 216; 408pp; English.
XX
CC The present invention describes a method for treating a proliferative
CC skin or eye disease and scarring. The method involves administering a
CC ribozyme (I) which cleaves RNA encoding a cytokine involved in
CC inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle
CC dependent kinase, growth factor or a reductase, or administering a
CC nucleic acid molecule (II) comprising a promoter operably linked to a
CC nucleic acid segment encoding (I). (I) can have antipsoriatic,
CC dermatological, cytostatic, antiseborrheic, antidiabetic, antisickling,
CC ophthalmological, vulnerary, keratolytic and virucide activities, and
CC cleaves RNA encoding cytokine involved in inflammation. (I) can be used
CC in gene therapy. (I) and (II) are useful for treating proliferative skin
CC diseases such as psoriasis, atopic dermatitis, actinic keratosis,
CC squamous or basal cell carcinoma and viral or seborrheic wart. They can
CC also be used for treating proliferative eye diseases such as diabetic
CC retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of
CC prematurity and retinal detachment, and for treating and preventing
CC scarring such as keloid, adhesion and hypertrophic or hypertrophic burn
CC scar. AAH57577 to AAH62099 represent sequences used in the
CC exemplification of the present invention

PT Set of novel map-related biallelic markers, preferably located on obesity
PT disorder-associated chromosomal regions on chromosomes 3, 10 and 19,
PT useful, for e.g. detecting statistical correlations between marker allele
PT and a phenotype.
XX
PS Example 20; Page 305; 311pp; English.
XX
CC The invention relates to a set of novel map-related biallelic markers,
CC preferably located on obesity disorder-associated chromosomal regions on
CC chromosomes 3, 10 and 19. The markers are useful for genotyping or
CC estimating the frequency of an allele in a population, for detecting an
CC association between a genotype or haplotype and a phenotype, e.g. a
CC disease involving drug responses, obesity or disorders related to
CC obesity, such as hyperuricaemia, digestive pathology, hepatic function
CC disorders, cancer, cardiovascular disease, hypertension, hyperlipidaemia,
CC insulin disorders, atheromatous disease and cardiac insufficiency. The
CC markers are useful for detecting a statistical correlation between a
CC biallelic marker allele and a phenotype and/or between a biallelic marker
CC haplotype and a phenotype. This sequence represents a PCR primer used to
CC amplify a human prostate cancer-associated biallelic marker

PT Detecting fetal aneuploidies or alleles of a gene of interest in fetal
PT DNA by determining the ratio of methylated and unmethylated DNA in
PT maternal serum is useful for prenatal detection of chromosome aberrations
PT and mutations.
XX
PS Example 4; Page 17; 31pp; English.
XX
CC The present invention describes methods for detecting foetal
CC aneuploidies, alleles of a gene of interest in foetal DNA and imprinted
CC genes in a subject. Also described: (1) detecting foetal aneuploidies
CC comprising treating DNA from maternal serum with a reagent that
CC differentially modifies methylated and non-methylated DNA and performing
CC quantitative PCR using one primer pair on a potentially aneuploid
CC chromosome and a on a non-aneuploid chromosome with an different primer
CC pair and comparing the ratio of the quantity of the two PCR products; (2)
CC detecting alleles of a gene of interest in foetal DNA, comprising
CC treating DNA isolated from maternal serum with bisulfite, performing PCR
CC with a primer pair that amplifies the gene of interest and analysing the
CC PCR product to identify the allele of the gene of interest; (3) detecting
CC imprinted genes in a subject comprises treating DNA isolated from the
CC subject with bisulfite, performing PCR with a primer pair for a
CC polymorphic region that only amplifies bisulfite-treated unmethylated DNA
CC and analysing the PCR product to identify the polymorphism thereby
CC detecting imprinted genes. The invention is used for prenatal detection
CC of chromosome aberrations and mutations. The present sequence represents
CC a PCR primer for the human ERG gene, which is used in an example from the
CC present invention. The human ERG gene is located on chromosome 21 within
CC the Down's critical region.

PT Determining a predisposition for or the occurrence of neurodegenerative
PT disease, e.g. Alzheimer's disease by detecting in a target nucleic acid
PT the presence or absence of an allelic variant of one or more polymorphic
PT regions.
XX
PS Example 3; Page 277; 848pp; English.
XX
CC The present invention relates to a method (M1) for determining a
CC predisposition for or the occurrence of neurodegenerative disease in a
CC subject. The method comprises detecting in a target nucleic acid obtained
CC from the subject the presence or absence of an allelic variant of one or
CC more polymorphic regions of one or more genes selected from uPA
CC (Urokinase plasminogen activator), SNCG (gamma-synuclein), IDE (insulin-
CC degrading enzyme), KNSL1 (Kinesin-like protein 1), LIPA (lysosomal acid
CC lypase), and TNFRSF6 (Tumour Necrosis Factor Receptor-SF6), where the
CC presence of at least one of the allelic variant of one or more
CC polymorphic regions is indicative of a predisposition for or the
CC occurrence of neurodegenerative disease. The genes are all located on
CC chromosome 10. M1 is useful for determining a predisposition for or the
CC occurrence of, and for treating neurodegenerative disease, particularly
CC Alzheimer's disease. The present sequence is a PCR primer, which was used
CC in the method of the invention.

PS Example 3; SEQ ID NO 858; 170pp; English.
XX
CC The invention relates to short interfering nucleic acids (siNA) which
CC downregulate expression of HIV gene by RNA interference. The siNAs may or
CC may not comprise ribonucleotides and may be double or single stranded.
CC They further comprise sense and antisense regions, or alternatively are
CC assembled from a sense oligonucleotide and an antisense oligonucleotide.
CC Specifically, the siNAs include short interfering RNA (siRNA), double-
CC stranded RNA, micro-RNA (miRNA) and short hairpin RNA (shRNA). The siNAs
CC can be unmodified or chemically modified, can contain
CC deoxyribonucleotides, and can be chemically synthesised, expressed from a
CC vector or enzymatically synthesised. The invention also relates to kits
CC for the in vitro or in vivo delivery of siNA; conjugates and/or complexes
CC of siNA; and vectors that express siNA. The siNAs are used to modulate
CC expression of the HIV gene in cells, tissue explants or organisms (e.g.,
CC by ex vivo gene therapy), or in grafts and transplants for the treatment
CC of a variety of conditions. HIV siNAs have anti-HIV activity. They may be
CC used for inhibiting replication of HIV and may be used to treat HIV
CC infection. The siNAs are also useful for drug screening, diagnosis,
CC therapeutic target identification and validation, genetic engineering,
CC pharmacogenomics, studying gene function, and gene mapping (e.g., of
CC single nucleotide polymorphisms). The present sequence represents the
CC lower strand of an HIV-targeted double-stranded siNA.

XX
CC   The invention relates to short interfering nucleic acids (siNA) which
CC   downregulate expression of HIV gene by RNA interference. The siNAs may or
CC   may not comprise ribonucleotides and may be double or single stranded.
CC   They further comprise sense and antisense regions, or alternatively are
CC   assembled from a sense oligonucleotide and an antisense oligonucleotide.
CC   Specifically, the siNAs include short interfering RNA (siRNA), double-
CC   stranded RNA, micro-RNA (miRNA) and short hairpin RNA (shRNA). The siNAs
CC   can be unmodified or chemically modified, can contain
CC   deoxyribonucleotides, and can be chemically synthesised, expressed from a
CC   vector or enzymatically synthesised. The invention also relates to kits
CC   for the in vitro or in vivo delivery of siNA; conjugates and/or complexes
CC   of siNA; and vectors that express siNA. The siNAs are used to modulate
CC   expression of the HIV gene in cells, tissue explants or organisms (e.g.,
CC   by ex vivo gene therapy), or in grafts and transplants for the treatment
CC   of a variety of conditions. HIV siNAs have anti-HIV activity. They may be
CC   used for inhibiting replication of HIV and may be used to treat HIV
CC   infection. The siNAs are also useful for drug screening, diagnosis,
CC   therapeutic target identification and validation, genetic engineering,
CC   pharmacogenomics, studying gene function, and gene mapping (e.g., of
CC   single nucleotide polymorphisms). The present sequence represents the
CC   upper strand of HIV-targeted double-stranded siNA, which is identical to
CC   the HIV transcript target sequence.

PT   Measurement of Cox-2 gene expression in cancer or virus-infected cells
PT   for estimating the therapeutic effect of an interferon in cancer and
PT   viral disease.
XX
PS   Disclosure; SEQ ID NO 4; 90pp; Japanese.
XX
CC   The invention relates to a method for estimating the therapeutic effect
CC   of interferon in the treatment of cancer or viral disease. The method
CC   involves determining the amount of expression of an interferon-associated
CC   gene in cancer cells or virus-infected cells. The invention also relates
CC   to drug compositions for the treatment of cancer and viral diseases
CC   containing interferon-alpha together with a cyclooxygenase-2 (Cox-2)
CC   inhibitor such as indomethacin which potentiates the apoptosis induction
CC   effect of the interferon. The method and compositions of the invention
CC   are useful in the treatment and prevention of cancers (e.g., cancer of
CC   the colon, lung, pancreas, breast, stomach, liver, kidney, nerve cell,
CC   skin, muscle, uterus and throat) and viral infections (e.g., hepatitis B
CC   and C). The present sequence represents a PCR primer used in real-time
CC   PCR to determine the amount of expression of an interferon-associated
CC   gene in cancer cells cultured in the presence of interferon-alpha.

PT   Selecting siRNA by selecting an siRNA molecule of 19-25 nucleoside bases
PT   by selecting a target gene and measuring the functionality of the
PT   nucleotide sequences that are complementary to a stretch of nucleotides
PT   of the target sequence.
XX
PS   Example 12; SEQ ID NO 1294; 199pp; English.
XX
CC   The invention relates to a novel method for selecting siRNA (short
CC   interfering RNA) comprising selecting an siRNA molecule of 19-25
CC   nucleoside bases by selecting a target gene and measuring the
CC   functionality of sequences of 19-25 nucleotides in length that are
CC   substantially complementary to a stretch of nucleotides of the target
CC   sequence, where the functionality is dependent upon non-target specific
CC   criteria. Also claimed are methods for gene-silencing, developing an
CC   siRNA algorithm for selecting siRNA, selecting an siRNA with improved
CC   functionality, selecting hyperfunctional siRNA, an siRNA molecule
CC   effective at silencing Bcl-2, and a kit for gene silencing comprising the
CC   siRNA. The siRNA molecule comprises a sequence substantially similar to a
CC   sequence consisting of GGGAGAUAGUGAUGAAGUA; GAAGUACAUCCAUUAUAAG;
CC   GUACGACAACCGGGAGAUA; AGAUAGUGAUGAAGUACAU; UGAAGACUCUGCUCAGUUU;
CC   CAUGCGGCCUCUGUUUGA; UGCGGCCUCUGUUUGAUUU; GAGAUAGUGAUGAAGUACA;
CC   GGAGAUAGUGAUGAAGUAC; and GAAGACUCUGCUCAGUUUG. The siRNA molecule
CC   comprises a sense strand and an anti-sense strand. The siRNA molecule
CC   comprises a hairpin. The siRNA molecule comprises between 18 and 30 base
CC   pairs. The kit comprises at least two siRNA, comprising a first optimised
CC   siRNA and a second optimised siRNA. The method is useful in selecting
CC   siRNA for generating a gene silencing reagent. The present sequence is
CC   used in the exemplification of the invention. The sequence is shown in
CC   the specification as DNA, but described as siRNA.

PT   Oligo:nucleotide(s) hybridising with RNA of Epstein Barr virus - for
PT   treating active, latent and chronic EBV infections and associated
PT   diseases e.g. nasopharyngeal carcinoma, Burkitt's lymphoma.
XX
PS   Claim 1; Page 20; 45pp; English.
XX
CC   The synthetic peptide is an antisense modulator of Epstein Barr virus and
CC   pref. contains at least one phosphorothioate linking gp. and
CC   modifications in the 2' position. These modifications improve penetration
CC   into regions of the cell that contain nucleic acid and also resistance to
CC   degradation by nucleases. The oligonucleotide targets an EBER-2 internal
CC   sequence and hybridises, thus inhibiting replication of EBV. The oligomer
CC   may be used for treating or preventing EBV-associated diseases, e.g.
CC   nasopharyngeal carcinoma, Burkitt's lymphoma, Sjogren's syndrome,
CC   infectious mononucleosis etc. The oligomer is effective against both
CC   latent and active EBV infection. See also AAQ40575-9 and AAQ41517-44.

PT   Detection of nucleic acids in cells - by in situ amplification of target
PT   sequences by thermophilic strand displacement amplification.
XX
PS   Claim 14; Page 16; 37pp; English.
XX
CC   This 32P labelled primer is an example of a detector probe for the
CC   amplified products of the gag gene of HIV. It is used in a modified
CC   version of thermophilic strand displacement amplification (tSDA) to
CC   amplify double stranded DNA in situ. Amplification primers (see AAT88932-
CC   3) are hybridised to both strands of the gene, and are extended. Both
CC   primers have a restriction endonuclease (RE) recognition site, and the
CC   products will also contain these sites. The products are displaced from
CC   the target sequence, by extension of the bumper primers (see AAT88941-
CC   42), which anneal upstream of the amplification primers, and made double
CC   stranded by synthesising complementary strands. Making the products
CC   double stranded causes "nicks" to be created (via the RE recognition
CC   sites). Further extension occurs from the nicks, thereby displacing a
```

```
CC   copy of the target sequence from the double stranded amplification primer
CC   extension products. The nicking, extending and displacing steps are
CC   repeated, and the target sequence amplified in situ. The method can be
CC   used for the amplification of DNA in situ in cells in suspension, on
CC   slides or in tissues, with speed, sensitivity and specificity. In situ
CC   tSDA also remains compatible with immunochemical techniques in spite of
CC   the increased reaction temparature so both amplification of DNA and
CC   immunological staining can be performed on the same specimen

PT   Retrovirus reacting with AIDS patient serum - useful for the exact
PT   diagnosis of an unknown AIDS causing virus.
XX
PS   Example; Page 7; 16pp; Japanese.
XX
CC   This primer is used in the nested PCR amplification of the DNA base
CC   sequences isolated from a retrovirus particle collected from the blood of
CC   an AIDS patient. The specification provides DNA base sequences encoding a
CC   retroviral protein which reacts with serum of AIDS patients. It provides
CC   an antigen for the detection of an antibody against retrovirus which
CC   consists of a peptide derived from these base sequences. The invention
CC   provides a method for antigen measurement in which the above antigen is
CC   contacted with a sample blood to determine immunoglobulin reacting with
CC   the antigen and a method for screening the infection of retrovirus other
CC   than HIV-1, HIV-2 subtype A which can be collected from an AIDS patient
CC   blood by the above antibody measurement. The method can diagnose exactly
CC   an unknown AIDS-causing virus

PT   830 Primers useful for synthesizing full length cDNA clones and their use
PT   in genetic manipulation.
XX
PS   Example 18; Page 128; 1380pp + Sequence Listing; English.
XX
CC   The invention relates to primers for synthesising full length cDNA
CC   clones. 830 cDNA molecules encoding a human protein have been isolated
CC   and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have
CC   been determined. Primers for synthesising the full length cDNA are useful
CC   for clarifying the function of the protein encoded by the cDNA. The full
CC   length clones were obtained by construction of full length enriched cDNA
CC   libraries that were synthesised by the oligo-capping method. The primers
CC   enable the production of the full length cDNA easily without any special
CC   methods. The present sequence is a primer used to amplify a human cDNA
CC   clone provided in the invention

PT   Novel antisense compounds capable of modulating expression of daxx useful
PT   for diagnosis, prophylaxis and treatment of diseases associated with
PT   expression of daxx.
XX
PS   Claim 1; Col 49; 59pp; English.
XX
CC   The present invention describes an antisense compound (I) up to 30
CC   nucleobases in length, where (I) inhibits expression of daxx (also known
CC   as Fas binding protein, CENP-C binding protein, dap6 for death associated
CC   protein 6 and EAP for Ets-1 associated protein). (I) has cytostatic and
CC   antiinflammatory activity, and can be used in antisense therapy and as a
CC   modulator of daxx. (I) is useful for inhibiting the expression of daxx in
CC   cells or tissues in vitro. (I) can be utilised for diagnostics,
CC   therapeutics for the treatment of diseases associated with the expression
CC   of daxx, prophylaxis e.g. to prevent or delay infection, inflammation or
CC   tumour formation and as research reagent. The present sequence represents
CC   an inhibitory human daxx antisense phosphorothioate oligonucleotide which
CC   is used in the exemplification of the present invention

PT   Knock-out animal resistant to lipopolysaccharide-induced endotoxin shock
PT   and tumor necrosis factor alpha-mediated inflammatory disease, comprises
PT   a functionally disrupted endogenous Tp12 gene.
XX
PS   Example 7; Page 48; 98pp; English.
XX
CC   The invention relates to an animal with a structurally intact Tp12 gene
CC   but functionally disrupted endogenous Tp12 (a protooncogene which encodes
CC   a cytoplasmic serine threonine protein kinase). The animal has increased
CC   resistance to lipopolysaccharide-induced endotoxin shock or tumour
CC   necrosis factor (TNF) alpha-mediated inflammatory diseases. Tp12 protein
CC   and DNA are useful for identifying compounds that agonise or inhibit the
CC   function of Tp12 protein. Tp12 is useful for treating rheumatoid
CC   arthritis. TNFalpha-mediated inflammatory diseases or LPS induced
CC   endotoxin shock, may be treated by transfecting bone marrow derived cells
CC   invitro with a DNA construct which encodes sequences that interferes with
CC   the expression of function of the endogenous Tp12 in the cells and
CC   administering the cells to an animal. The knock out animals and the
CC   constructs used to generate the animals are useful in the development of
CC   compositions and methods of treating inflammation. Tp12 agonist and
CC   antagonist are useful as targets for the development of novel therapeutic
CC   agents which eliminate the functional role of Tp12 and as research tools
CC   to facilitate the elucidation of the mechanistic action of the novel
CC   genetic and protein interactions involved in inflammatory disorders. Tp12
CC   polynucleotide sequences facilitate the discovery and development of anti
CC   endotoxin shock and/or antiinflammatory compounds. The present sequence
CC   is a reverse transcription (RT) PCR used for amplifying human TNFalpha
CC   cDNA

PT   Predicting the potential of an oligonucleotide to hybridize to a target
PT   nucleotide sequence, useful for evaluating oligonucleotide probe
PT   sequences, by identifying a oligonucleotides based on the evaluation of
PT   parameters.
XX
PS   Example 2; Col 65; 342pp; English.
XX
CC   The present invention describes a method for predicting the potential of
CC   an oligonucleotide to hybridise to a (complementary) target nucleotide
CC   sequence, involving identifying a subset of oligonucleotides within the
CC   predetermined number of unique oligonucleotides based on the evaluation
CC   of the parameter. Oligonucleotides in the subset are identified that are
CC   clustered along a region of the nucleotide sequence that is hybridisable
CC   to the target nucleotide sequence. This is useful for evaluating
CC   oligonucleotide probe sequences. The present sequence is an
CC   oligonucleotide described in the exemplification of the invention.

PT   New nucleic acid oligomers for amplifying a nucleotide sequence from HIV-
PT   1 and probes for detecting the amplified product are specific for gag and
PT   pol regions and are useful to detect different subtypes of HIV-1.
XX
PS   Claim 1; Page 27; 37pp; English.
XX
CC   This invention relates to a series of nucleic acid oligomers for
CC   amplifying and detecting a nucleotide sequence of human immunodeficiency
CC   virus type 1 (HIV-1). The invention also comprises a labeled
CC   oligonucleotide that specifically hybridises to an HIV-1 sequence derived
CC   from gag or pol sequences, having one of the sequences fully defined in
CC   the specification, and a method for detecting HIV-1 in a biological
CC   sample, comprising mixing the sample with two or more of the
CC   amplification oligomers that specifically amplify at least one HIV-1
CC   target sequence within gag and a pol sequence which is a protease or
CC   reverse transcriptase sequence, amplifying the target, and detecting the
CC   amplified product. The oligonucleotides of the invention may be used to
CC   diagnose HIV-1 infection. The presents sequence represents a PCR primer
CC   used to amplify the HIV-1 Gag gene in the HIV detection method of the
CC   invention. (Updated on 29-AUG-2003 to standardise OS field)

PT New SHORT-ROOT genes, useful for improving agronomically valuable plants,
PT particularly for altering or regulating the root and/or stem structure of
PT transgenic plants to produce plants that are less susceptible to lodging.
XX
PS Example 6.14; Page 68; 142pp; English.
XX
CC This invention relates to the nucleic acid and protein sequence of a
CC novel gene Short-root (SHR). SHR is expressed mainly in roots and
CC controls cell cell division of certain types of roots affecting
CC gravitropism and the organisation of root and stem. The invention also
CC comprises an antibody that immunospecifically binds the SHR protein and
CC plants genetically-engineered to overexpress or underexpress a SHR
CC protein or polypeptide, so that cell division is modified, and root
CC and/or stem development is altered. The SHR genes are useful for
CC improving agronomically valuable plants. The SHR genes are particularly
CC useful for altering or regulating the root and/or stem structure, and the
CC gravitropism of aerial structures of transgenic plants. The genes are
CC also useful for developing straighter transgenic plants that are less
CC susceptible to lodging. The present sequence represents the En8183 maize
CC transposon En-specific PCR primer, this primer was used in conjunction
CC with the primer En7631 (ABK14156) to generate an En-specific probe to
CC allow genotyping of progeny from an Shr3 heterozygote. Shr-3 and Shr-4
CC alleles were identified in lines containing the autonomously replicating
CC maize transposon En. (Updated on 07-AUG-2003 to correct OS field.)

PT Novel isolated or substantially purified Von Willebrand factor-cleaving
PT protease, useful for producing preparation for therapy of thrombosis and
PT thromboembolic disease such as thrombotic thrombocytic purpura.
XX
PS Example 3; Page 34; 93pp; English.
XX
CC The invention relates to an isolated or substantially pure Von Willebrand
CC factor-cleaving protease (vWF-cp) polypeptide. vWF-cp is useful for
CC purifying vWF which involves providing vWF-cp as a ligand, contacting a
CC solution comprising vWF with the polypeptide ligand under conditions
CC where vWF is bound to the ligand and recovering from the ligand purified
CC vWF. vWF-cp is useful for producing anti-vWF cp polypeptide antibodies
CC which involves immunising an animal with vWF-cp and isolating the anti-
CC vWF cp polypeptide antibodies from the animal. vWF-cp is useful for
CC producing a preparation of prophylaxis and therapy of thrombosis and
CC thromboembolic disease such as thrombotic thrombocytic purpura (TTP),
CC Henoch-Schonlein purpura, preeclampsia, neonatal thrombocytopaenia or
CC haemolytic-uraemic syndrome. vWF-cp can also be used for processing
CC plasmatic or recombinantly produced vWF. The invention is useful for
CC construction expression systems and generating transgenic animals which
CC express the polypeptide in vivo. The present sequence is human vWF-cp
CC gene cloning RT-PCR primer

PS   Claim 3; Page 25; 0pp; English.
XX
CC   The present invention provides antisense compounds targetted to nucleic
CC   acid molecule encoding Ship-1 (also known as SH2-containing
CC   phosphatidylinositol phosphatase-1 and INPP5D) to modulate/inhibit the
CC   expression of Ship-1. The invention is useful in treatment of diseases
CC   such as insensitivity to apoptotic signals, autoimmune disorders,
CC   developmental disorders and inflammatory disorders. The present sequence
CC   is human Ship-1 antisense oligonucleotide

PT Pharmaceutical composition for treating ailments associated with impaired
PT respiration, has oligo(s) antisense to specific gene(s) or its
PT corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
PT ubiquinone.
XX
PS Disclosure; SEQ ID NO 5916; 872pp; English.
XX
CC The invention relates to a novel pharmaceutical composition, which has a
CC first active agent comprising an oligonucleotide antisense to the
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC junctions of genes encoding a polypeptide associated with lung and/or
CC nasal airway dysfunction and a second active agent comprising an
CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC immunosuppressive, and cytostatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC receptor, producing bronchodilation, increasing levels of ubiquinone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.

CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC receptor, producing bronchodilation, increasing levels of ubiquinone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.

```
PT   Pharmaceutical composition for treating ailments associated with impaired
PT   respiration, has oligo(s) antisense to specific gene(s) or its
PT   corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
PT   ubiquinone.
XX
PS   Disclosure; SEQ ID NO 3910; 872pp; English.
XX
CC   The invention relates to a novel pharmaceutical composition, which has a
CC   first active agent comprising an oligonucleotide antisense to the
CC   initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC   5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC   junctions of genes encoding a polypeptide associated with lung and/or
CC   nasal airway dysfunction and a second active agent comprising an
CC   antiinflammatory steroid and ubiquinone. A composition of the invention
CC   has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC   immunosuppressive, and cytostatic activity. The composition may have a
CC   use in antisense gene therapy. The composition is useful for treating or
CC   preventing a respiratory, lung or malignant disease or condition, also
CC   for enhancing the prophylactic or therapeutic respiratory effect of an
CC   antiinflammatory steroid in a subject, for reducing or depleting levels
CC   of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC   receptor, producing bronchodilation, increasing levels of ubiquinone or
CC   lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC   lung inflammation, lung allergies, or a respiratory disease or condition.

PT   Diagnosing CHILD syndrome or psoriasis, by detecting differences between
PT   patient and wild type genes encoding 3 beta-hydroxysteroid dehydrogenase
PT   or accumulation of sterol intermediates in body fluids of the patient.
XX
PS   Disclosure; Page 2; 23pp; English.
XX
CC   The invention relates to diagnosing congenital hemidysplasia,
CC   ichthyosiform erythroderma and limb defects (CHILD) syndrome or psoriasis
CC   in a patient, involves detecting nucleotide difference between patient
CC   NSDHL oligonucleotide (gene encoding 3beta-hydroxysteroid dehydrogenase
CC   (3beta-HSD)) and wild type NSDHL gene, or detecting accumulation of
CC   sterol intermediates before the generation of cholest-8(9)-en-3beta-ol in
CC   the cholesterol biosynthetic pathway, in the body fluids or cells of the
CC   patient. The method is useful for diagnosing CHILD syndrome and psoriasis
CC   in a patient. Other diseases implicated in defects of the cholesterol
CC   biosynthetic pathway include mevalonic aciduria, desmosterolosis, Smith-
CC   Lemli-Opitz syndrome (SLOS), Conradi-Hunermann- Happle syndrome;
CC   chondroplasia punctata (X-linked disease), bone disorders, osteoporosis,
CC   osteosclerosis, skin disorders, ichthyosis, eye disorders, (e.g. cataract
CC   and microopthalmia) and arthritis. The human NSDHL gene is located on
CC   chromosome X128. The present sequence is a primer for routine sequencing
CC   of and mutation detection in the human NSDHL gene (one of 8 exons or the
CC   non-coding region)

PT   nucleic acids associated with lung airway or lung dysfunction, and
PT   bronchodilating agent.
XX
PS   Claim 15; SEQ ID NO 5916; 763pp; English.
XX
CC   This invention describes a novel composition (a) a first active agent,
CC   comprising oligonucleotides, effective for alleviating
CC   bronchoconstriction, respiratory tract inflammation, allergies and
CC   reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,
CC   surfactant depletion or hyposecretion, when administered to a mammal. The
CC   oligonucleotides are derived from a gene encoding or regulating
CC   expression of a target polypeptide associated with lung airway or lung
CC   dysfunction or cancer and can be anti-sense to the corresponding mRNA.
CC   The invention also describes a kit, that comprises: (a) a delivery
CC   device, in separate containers, (b) the oligonucleotides, (c)
CC   instructions for adding a carrier and for use of the kit. The composition
CC   of the invention has antiallergic, antiinflammatory, antiasthmatic,
CC   analgesic, hypotensive, immunosuppressive and cytostatic activity, is a
CC   beta-adrenergic agonist. The composition is useful for preventing or
CC   treating a respiratory, lung or malignant disease. The administered
CC   composition comprises oligo and is administered to reduce the production
CC   or availability, or to increase the degradation of the target mRNA or to
CC   reduce the amount of target polypeptide present in the lungs. The
CC   pulmonary obstruction, and/or bronchoconstriction and/or lung
CC   inflammation, allergies and/or surfactant hypoproduction are associated
CC   with a disease or condition such as pulmonary vasoconstriction,
CC   inflammation, allergies, asthma, impeded respiration, respiratory
CC   distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary
CC   hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary
CC   transplantation rejection, pulmonary infections, bronchitis or cancer.
CC   The reduced adenosine content of the anti-sense oligos corresponding to
CC   thymidines present in the target RNA serves to prevent the breakdown of
CC   the oligonucleotides into products that free adenosine into the system
CC   e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to
CC   prevent any unwanted effects due to it

XX
PT Pharmaceutical composition for treating asthma, has antisense
PT oligonucleotide containing less percentage of adenosine, targeted to
PT nucleic acids associated with lung airway or lung dysfunction, and
PT bronchodilating agent.
XX
PS Claim 15; SEQ ID NO 5749; 763pp; English.
XX
CC This invention describes a novel composition (a) a first active agent,
CC comprising oligonucleotides, effective for alleviating
CC bronchoconstriction, respiratory tract inflammation, allergies and
CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,
CC surfactant depletion or hyposecretion, when administered to a mammal. The
CC oligonucleotides are derived from a gene encoding or regulating
CC expression of a target polypeptide associated with lung airway or lung
CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.
CC The invention also describes a kit, that comprises: (a) a delivery
CC device, in separate containers, (b) the oligonucleotides, (c)
CC instructions for adding a carrier and for use of the kit. The composition
CC of the invention has antiallergic, antiinflammatory, antiasthmatic,
CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a
CC beta-adrenergic agonist. The composition is useful for preventing or
CC treating a respiratory, lung or malignant disease. The administered
CC composition comprises oligo and is administered to reduce the production
CC or availability, or to increase the degradation of the target mRNA or to
CC reduce the amount of target polypeptide present in the lungs. The
CC pulmonary obstruction, and/or bronchoconstriction and/or lung
CC inflammation, allergies and/or surfactant hypoproduction are associated
CC with a disease or condition such as pulmonary vasoconstriction,
CC inflammation, allergies, asthma, impeded respiration, respiratory
CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary
CC hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary
CC transplantation rejection, pulmonary infections, bronchitis or cancer.
CC The reduced adenosine content of the anti-sense oligos corresponding to
CC thymidines present in the target RNA serves to prevent the breakdown of
CC the oligonucleotides into products that free adenosine into the system
CC e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to
CC prevent any unwanted effects due to it

PT New isolated nucleic acid or alternate splice variant, useful for
PT diagnosing and treating a disintegrin and metalloprotease (ADAM) or
PT interactor gene-associated disorder, e.g. asthma, atopy, obesity or
PT inflammatory bowel disease.
XX
PS Claim 2; Page 128; 338pp; English.
XX
CC The invention relates to an isolated nucleic acid or alternate splice
CC variant comprising a nucleotide sequence containing at least one of the
CC single nucleotide polymorphisms given in the specification, a nucleotide
CC sequence having at least 15 contiguous nucleotides of them, or
CC complements of them. The genes are ADAM19 (a disintegrin and
CC metalloprotease 19, also known as gene 845), NRG2 (neuroregulin 2, also
CC known as gene 847), endophilin 1 (also known as gene 874), endophilin 2
CC (also known as gene 803) and ADAMTS2 (a disintegrin and metalloprotease
CC with thrombospondin type1 motif 2, also known as gene 962). Also included
CC are a vector comprising the isolated nucleic acid (or alternate splice
CC variant), a host cell containing the vector, an isolated polypeptide
CC encoded by the novel nucleic acid (or alternate splice variant), an
CC antibody or antibody fragment that binds to the polypeptide,
CC pharmaceutical compositions (comprising the nucleic acid or alternate
CC splice variant, vector, polypeptide or antibody , and a carrier,
CC excipient or diluent), a kit for detecting a disintegrin and
CC metalloprotease (ADAM) gene nucleotide sequence (comprising the isolated
CC nucleic acid or alternate splice variant, antibody or antibody fragment,
CC and at least one component to detect the hybridisation of the variant or
CC the binding of the antibody to an ADAM gene amino acid sequence), a kit
CC for detecting an interactor gene amino acid sequence (comprising the
CC antibody or antibody fragment, and at least one component to detect the
CC binding of the antibody to the interactor gene amino acid sequence),
CC diagnosing an ADAM or interactor gene-associated disorder or a
CC respiratory disorder in a human subject, determining an ADAM or
CC interactor gene pharmacogenetic profile in a human subject, identifying
CC an orthologue of a human ADAM or interactor gene, treating an ADAM or
CC interactor gene-associated disorder (or a respiratory disorder) by
CC administering the pharmaceutical composition, a transgenic mouse (whose
CC genome comprises an introduced null mutation in an endogenous gene that
CC is orthologous to a human ADAM gene), making a homozygous transgenic
CC knockout mouse, forming a crystal of the isolated polypeptide, a cell
CC line comprising the isolated nucleic acid or alternate splice variant, a
CC biochip comprising the isolated nucleic acid or alternate splice variant,
CC an isolated nucleic acid probe or primer comprising at least 8 contiguous
CC nucleotides of the nucleic acid, an isolated antisense nucleic acid,
CC identifying an ADAM or interactor gene ligand and an isolated nucleic
CC acid variant of Gene 803, 845, 847, 874 or 962. The nucleic acid or
CC alternate splice variants, methods, kits and antibody/antibody fragment
CC are useful for diagnosing and treating an ADAM or interactor gene-
CC associated disorder, e.g. asthma, atopy, obesity or inflammatory bowel
CC disease. The present sequence is a primer used to sequence the regions
CC surrounding polymorphisms in the above genes.

PT   New antisense oligonucleotides targeted to a nucleic acid encoding liver
PT   related homologue-1 (LRH1), useful for treating breast cancer,
PT   dyslipidemia, atherosclerosis, hypercholesterolemia, or hepatitis.
XX
PS   Example 15; SEQ ID NO 3389; 909pp; English.
XX
CC   This invention relates to novel antisense compounds useful for modulating
CC   the expression of liver related homologue-1 (LRH1) and splice variants
CC   thereof. Specifically, it refers to compositions 8-30 nucleobases in
CC   length that target a portion of an active site on the nucleic acid
CC   molecule encoding LRH1 (also known as NR5A2). LRH1 is a monomeric orphan
CC   nuclear receptor protein that functions as a tissue specific
CC   transcription factor. The present invention describes antisense
CC   oligonucleotides that comprise at least one modified internucleoside
CC   linkage, a phosphorothioate linkage; at least one modified sugar moiety,
CC   a 2'-O-methoxyethyl (2' MOE) and at least one modified nucleobase, a 5-
CC   methylcytidine. These antisense compounds are useful for treating or
CC   diagnosing a disease associated with LRH1, such as breast cancer,
CC   dyslipidaemia, atherosclerosis, low HDL (high density lipoprotein), high
CC   LDL (low density lipoprotein), hypercholesterolaemia, gall stones,
CC   triglyceridaemia, obesity, hepatitis B virus-mediated acute or chronic
CC   hepatitis, as well as hepatocellular carcinoma or a condition associated
CC   with aromatase activity. Accordingly, these compositions exhibit
CC   cytostatic, antilipaemic, antiarteriosclerotic, anorectic, hepatotropic,
CC   litholytic, antiinflammatory and virucidal activities. This
CC   oligonucleotide sequence is an antisense DNA oligo used to modulate the
CC   expression of the human LRH1 protein of the invention.

PT   New antisense oligonucleotides targeted to a nucleic acid encoding liver
PT   related homologue-1 (LRH1), useful for treating breast cancer,
PT   dyslipidemia, atherosclerosis, hypercholesterolemia, or hepatitis.
XX
PS   Example 15; SEQ ID NO 2901; 909pp; English.
XX
CC   This invention relates to novel antisense compounds useful for modulating
CC   the expression of liver related homologue-1 (LRH1) and splice variants
CC   thereof. Specifically, it refers to compositions 8-30 nucleobases in
CC   length that target a portion of an active site on the nucleic acid
CC   molecule encoding LRH1 (also known as NR5A2). LRH1 is a monomeric orphan
CC   nuclear receptor protein that functions as a tissue specific
CC   transcription factor. The present invention describes antisense
CC   oligonucleotides that comprise at least one modified internucleoside
CC   linkage, a phosphorothioate linkage; at least one modified sugar moiety,
CC   a 2'-O-methoxyethyl (2' MOE) and at least one modified nucleobase, a 5-
CC   methylcytidine. These antisense compounds are useful for treating or
CC   diagnosing a disease associated with LRH1, such as breast cancer,
CC   dyslipidaemia, atherosclerosis, low HDL (high density lipoprotein), high
CC   LDL (low density lipoprotein), hypercholesterolaemia, gall stones,
CC   triglyceridaemia, obesity, hepatitis B virus-mediated acute or chronic
CC   hepatitis, as well as hepatocellular carcinoma or a condition associated
CC   with aromatase activity. Accordingly, these compositions exhibit
CC   cytostatic, antilipaemic, antiarteriosclerotic, anorectic, hepatotropic,
CC   litholytic, antiinflammatory and virucidal activities. This
CC   oligonucleotide sequence is an antisense DNA oligo used to modulate the
CC   expression of the human LRH1 protein of the invention.

XX
CC   This invention relates to a novel primers useful for synthesising full
CC   length cDNA molecules that encode human proteins. Specifically, it refers
CC   to secretory or membrane proteins that are potential therapeutic agents/
CC   target molecules in the field of medicine, and in particular genes
CC   encoding proteins that are associated with signal transduction,
CC   glycoproteins and transcription. The present invention describes a method
CC   for efficiently cloning a full length human cDNA from both the 5' and 3'
CC   ends using the oligo-capping method. This oligonucleotide sequence is a
CC   human clone specific PCR primer used in an exemplification of the
CC   invention.

PT   New compounds, particularly antisense oligonucleotides targeted to a
PT   nucleic acid encoding glutamine-fructose-6-phosphate amidotransferase
PT   (GFAT), for treating diabetes, a cardiovascular or neurologic disorder,
PT   ischemia/reperfusion injury.
XX
PS   Claim 4; SEQ ID NO 2367; 175pp; English.
XX
CC   The present invention relates to a compound which specifically hybridizes
CC   with a nucleic acid molecule encoding GFAT, and inhibits the expression
CC   of GFAT. Specifically claimed are antisense oligonucleotides capable of
CC   modulating the expression of GFAT, and which comprise any of the 3063
CC   sequences of 20 base pairs, given in the specification. The compound,
CC   composition and methods are useful for treating a disease or condition
CC   associated with GFAT, such as a disease or condition, e.g. diabetes, a
CC   cardiovascular or neurological disorder, ischemia/reperfusion injury.
CC   They are also useful in research and diagnostics for modulating the
CC   expression of GFAT. The present sequence represents a chimeric
CC   phosphorothioate oligonucleotide with 2'-MOE wings and a deoxy gap, these
CC   oligonucleotides inhibit human GFAT expression.

PT   New antisense oligonucleotides useful for modulating Cytokine-inducible
PT   kinase expression, useful for diagnosing, preventing or treating
PT   conditions associated with aberrant kinase expression e.g.
PT   hyperproliferative disorders.
XX
PS   Example 15; SEQ ID NO 91; 56pp; English.
XX
CC   The invention describes a compound 8-80 nucleobases in length targeted to
CC   a nucleic acid molecule encoding Cytokine-inducible kinase. The compound
CC   specifically hybridises with the nucleic acid molecule encoding Cytokine-
CC   inducible kinase (which comprises a sequence of 2169 bp fully defined in
CC   the specification) and inhibits the expression of Cytokine-inducible
CC   kinase. Also described are: a method of inhibiting the expression of
CC   Cytokine-inducible kinase in cells or tissues, comprising contacting the
CC   cells or tissues with the new compound so that the expression of Cytokine
CC   -inducible kinase is inhibited; a method of screening for a modulator of
CC   Cytokine-inducible kinase, comprising contacting a preferred target
CC   segment of the nucleic acid encoding Cytokine-inducible kinase with one
CC   or more candidate modulators of Cytokine-inducible kinase, and
CC   identifying one or more modulators that modulate the expression of
CC   Cytokine-inducible kinase; a diagnostic method for identifying a disease
CC   state, comprising identifying the presence of Cytokine-inducible kinase
CC   in a sample using at least one of the primers or probe comprising the
CC   nucleotide sequences as mentioned in the specification; a kit or assay
CC   device comprising the above compound; and a method of treating an animal
CC   having a disease or condition associated with Cytokine-inducible kinase,
CC   comprising administering to the animal a therapeutic or prophylactic
CC   amount of the compound so that expression of Cytokine-inducible kinase is
CC   inhibited. The antisense oligonucleotide is useful for inhibiting the
CC   expression of Cytokine-inducible kinase in cells or tissues to prevent or
CC   treat diseases associated with the kinase expression, such as
CC   hyperproliferative disorders. In addition, the compound is used for
CC   diagnostics, prophylaxis, or as research reagents or kits. This sequence
CC   represents a human cytokine-inducible kinase antisense oligonucleotide.

PT   Thiazide sensitive cotransporter and ATP sensitive potassium channel
PT   genes - useful for developing products for the diagnosis and treatment of
PT   ion transport disorders, e.g. Gitelman's Syndrome or Bartter's Syndrome.
XX
PS   Example 1; Page 51; 105pp; English.
XX
CC   Primers hTSCex3 forward and reverse (see AAV40571 and AAV40572,
CC   respectively) are designed to amplify exon 3 of the human hTSC gene (see
CC   AAV40561) that codes for thiazide-sensitive Na-Cl cotransporter TSC (see
CC   AAW29682). Both primers are located within introns of hTSC. 27 Sets of
CC   specific primers (see AAV40565-V40618) were used for SSCP analysis of
CC   hTSC. Amplified products were analysed for molecular variants by
CC   electrophoresis, and identified variants were sequenced. Complete linkage
CC   of Gitelman's syndrome with TSC was demonstrated. Identification of the
CC   molecular basis of Gitelman's syndrome allows for the genetic diagnosis
CC   of this disorder. The invention provides products and methods useful for
CC   diagnosis and treatment of Gitelman's syndrome and other ion transport
CC   disorders

PS   Claim 8; Page 1986; 2745pp; English.
XX
CC   AAZ65654 to AAZ69578 represent human biallelic markers from the present
CC   invention, which contain a polymorphic base at position 24 of their
CC   nucleotide sequences. AAZ69579 to AAZ77440 represent amplification
CC   primers for the biallelic markers. The biallelic markers of the invention
CC   have a variety of uses: they can be used for high density mapping of the
CC   human genome, and in complex association studies and haplotyping studies
CC   which are useful in determining the genetic basis for disease states.
CC   Compositions and methods of the invention can also be useful for the
CC   identification of the targets for the development of pharmaceutical
CC   agents and diagnostic methods, as well as the characterisation of the
CC   differential efficacious responses to and side effects from
CC   pharmaceutical agents acting on a disease as well as other treatment.

XX
CC   AAZ65654 to AAZ69578 represent human biallelic markers from the present
CC   invention, which contain a polymorphic base at position 24 of their
CC   nucleotide sequences. AAZ69579 to AAZ77440 represent amplification
CC   primers for the biallelic markers. The biallelic markers of the invention
CC   have a variety of uses: they can be used for high density mapping of the
CC   human genome, and in complex association studies and haplotyping studies
CC   which are useful in determining the genetic basis for disease states.
CC   Compositions and methods of the invention can also be useful for the
CC   identification of the targets for the development of pharmaceutical
CC   agents and diagnostic methods, as well as the characterisation of the
CC   differential efficacious responses to and side effects from
CC   pharmaceutical agents acting on a disease as well as other treatment.

XX
CC   The present invention provides a method of diagnosing a vascular disease
CC   in an individual, involving determining the sequence at various
CC   polymorphic sites within the human thrombospondin 1 and thrombospondin 4
CC   genes. The sequences at a number of polymorphic sites are also provided
CC   in the specification. In particular, the method can be used in the
CC   diagnosis of atherosclerosis, myocardial infarction, coronary heart
CC   disease, stroke, peripheral vascular diseases, venous thromboembolism and
CC   pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also
CC   useful in forensics, paternity testing, genetic analysis and phenotype
CC   correlations to diseases. The present sequence is an example of one of
CC   the human gene SNPS shown in the specification

PT between 16S and 23S genes and region of Domain I in 23S region of
PT Chlamydiaceae, useful for assaying and identifying all strains of
PT Chlamydiaceae.
XX
PS Claim 2; Col 11; 89pp; English.
XX
CC The present PCR primer was used to amplify intergenic spacer target
CC sequences derived from Chlamydiaceae. The sequences comprise the
CC intergenic spacer between the 16S and the 23S rRNA genes, including the
CC far downstream end of the 16S and the far upstream end of the 23S domain
CC I flanking intergenic spacer (referred to as Region A), and secondarily,
CC a 131 bp region in the 3' end of Domain I (referred to as Region B). The
CC sequences provide suitable target sequences for developing probes and
CC primers which are useful for identifying and detecting Chlamydiaceae. The
CC primers and probes can be used to identify the presence of Chlamydiaceae
CC in a test sample, or to distinguish one strain from another, and for
CC diagnosing chlamydial infections in humans and animals

XX
CC   This invention relates to a series of nucleic acid oligomers for
CC   amplifying and detecting a nucleotide sequence of human immunodeficiency
CC   virus type 1 (HIV-1). The invention also comprises a labeled
CC   oligonucleotide that specifically hybridises to an HIV-1 sequence derived
CC   from gag or pol sequences, having one of the sequences fully defined in
CC   the specification, and a method for detecting HIV-1 in a biological
CC   sample, comprising mixing the sample with two or more of the
CC   amplification oligomers that specifically amplify at least one HIV-1
CC   target sequence within gag and a pol sequence which is a protease or
CC   reverse transcriptase sequence, amplifying the target, and detecting the
CC   amplified product. The oligonucleotides of the invention may be used to
CC   diagnose HIV-1 infection. The presents sequence represents a PCR primer
CC   used to amplify the HIV-1 Gag gene in the HIV detection method of the
CC   invention. (Updated on 29-AUG-2003 to standardise OS field)

PT   New composition useful for detecting and characterizing nucleic acid
PT   sequences and sequence variants for detecting the presence of viral or
PT   bacterial infections or cancer, comprises purified or chimerical FEN-1
PT   endonuclease.
XX
PS   Example 65; SEQ ID NO 413; 871pp; English.
XX
CC   The invention discloses a new composition (I) which comprises a purified
CC   flap endonuclease-1 (FEN-1) from e.g. Sulfolobus solfataricus,
CC   Pyrobaculom aerophilum or a chimerical FEN-1 endonuclease having a
CC   portion of the above endonuclease in addition to that of Pyrococcus
CC   horikoshii and Aeropyrum pernix. Also claimed is a composition comprising
CC   an isolated nucleic acid sequence encoding the endonuclease mentioned
CC   above, a composition comprising a vector having the nucleic acid sequence
CC   cited above, a composition comprising a host cell and vector cited above,
CC   a mixture comprising a first structure-specific nuclease selected from
CC   the species mentioned in composition (I), and a purified second structure
CC   -specific nuclease and detecting a target sequence, comprising: (a)
CC   providing a sample suspected of containing the target sequence,
CC   oligonucleotides capable of forming an invasive cleavage structure in the
CC   presence of the target sequence, and a FEN-1 endonuclease selected from
CC   the species cited above and (b) exposing the sample to the
CC   oligonucleotides and FEN-1 endonuclease. The second structure-specific
CC   nuclease also comprises a thermostable DNA polymerase. It has a 5'
CC   nuclease derived from a DNA polymerase altered in amino acid sequence
CC   such that it exhibits reduced DNA synthetic activity from that of the
CC   wild-type DNA polymerase but retains substantially the same 5' nuclease
CC   activity of the wild-type DNA polymerase. The second structure is
CC   selected from CLEAVASE BN enzyme, CLEAVASE DA enzyme, CLEAVASE DN enzyme,
CC   CLEAVASE DV enzyme, CLEAVASE BN/thrombin enzyme, CLEAVASE TThDN enzyme,
CC   T. aquaticus DNA polymerase, T. thermophilus DNA polymerase, E. coli Exo
CC   III and S. cerevisiae Rad1/Rad10 complex. The nucleic acid treatment kit
CC   comprises (I) and oligonucleotides capable of forming an invasive
CC   cleavage structure in the presence of a target nucleic acid. The
CC   oligonucleotides comprise: (a) a first oligonucleotide having a 5'
CC   portion complementary to a first portion of a target nucleic acid and (b)
CC   a second oligonucleotide comprising a 5' portion complementary to a
CC   second portion of the target nucleic acid downstream of and contiguous to
CC   the first portion and a 3' portion. The 3' portion of the second
CC   oligonucleotide comprises a single 3' terminal nucleotide not
CC   complementary to the target nucleic acid. Additionally, the kit has a
CC   third oligonucleotide complementary to a third portion of the target
CC   nucleic acid upstream of the first portion of the first target nucleic
CC   acid. In detecting a target sequence, the oligonucleotides and
CC   endonuclease are mixed under conditions where an invasive cleavage
CC   structure is formed between the target sequence and the oligonucleotides
CC   if the target sequence is present in the sample, where the invasive
CC   cleavage structure is cleaved by the endonuclease to form a cleavage
CC   product. The composition is useful in detecting and characterising
CC   specific nucleic acid sequences and sequence variants which can be used
CC   in detecting the presence of viral or bacterial infections, and other
CC   diseases such as cancer. The composition may also be used in forensic
CC   analysis or for paternity determinations. The sequence presented is a FEN
CC   -1 related DNA used within the scope of the invention.

PT   Novel short interfering RNA (siRNA) comprises sense and antisense RNA
PT   strands, useful for inhibiting expression of human vascular endothelial
PT   growth factor mRNA, for treating angiogenic disease, e.g. diabetic
PT   retinopathy and cancer.
XX
PS   Disclosure; SEQ ID NO 252; 218pp; English.
XX
CC   This invention relates to novel compositions that comprise short
CC   interfering RNA (siRNA) molecules, which can be used to inhibit
CC   angiogenesis. Specifically, it refers to siRNAs that target and cause
CC   RNAi-induced degradation of mRNA from human vascular endothelial growth
CC   factor (VEGF), the VEGF receptor (Flt-1) and the Flk-1/KDR (kinase domain
CC   region) genes, as well as mutants derived thereof. The present invention
CC   describes sense and antisense RNA strands that form an RNA duplex and
CC   bind to the target mRNA, such that expression is inhibited and the target
CC   degraded. As such, siRNA administered in combination with a therapeutic
CC   agent is useful for treating diseases associated with angiogenesis and
CC   the overexpression of VEGF, which include diabetic retinopathy, age-
CC   related macular degeneration, inflammatory disease, psoriasis and
CC   rheumatoid arthritis. Furthermore, it can be used to treat various
CC   cancers including breast, retinoblastoma, Wilm's tumour and lymphoma.
CC   Accordingly, these compositions exhibit cytostatic, antidiabetic,
CC   ophthalmological, antiinflammatory, antipsoriatic, antirheumatic and
CC   antiarthritic activities. This oligonucleotide is a human Flt-1 DNA
CC   oligo, a target for siRNA inhibition of the invention.

PT   Analysis of DNA tandem nucleotide repeat alleles by extending a target
PT   nucleic acid using primers and analysis by mass spectrometry.
XX
PS   Claim 99; Page 25; 136pp; English.
XX
CC   This sequence represents a PCR primer for a DNA tandem nucleotide repeat
CC   (DTNR) locus that can be used in the method of the invention. The method
CC   is for analysing DTNR alleles in a target nucleic acid, and comprises
CC   extending the target nucleic acid using primers complementary to
CC   sequences flanking the repeat and analysis by mass spectrometry. The
CC   products and methods can be used for genetic identity detection including
CC   forensic identification and paternity testing as well as genetic mapping.
CC   The use of mass spectrometry for characterising DTNRs provides for high
CC   speed of analysis (a few seconds per sample) and accurate direct mass
CC   measurements

PT   Mammalian asthma related genes, useful for diagnosis of a predisposition
PT   to development of asthma.
XX
PS   Disclosure; Page 58; 195pp; English.
XX
CC   The invention identifies a genetic locus ASTH1, associated with asthma,
CC   mapped to human chromosome 11p. ASTH1I and ASTHIJ are genes present
CC   within the locus, located close to each other on human chromosome 11p,
CC   and have similar patterns of expression, and common sequence motifs. The
CC   ASTH1 genes and fragments, encoded protein, genomic regulatory regions
CC   and anti-ASTH1 antibodies are useful in the identification of individuals
CC   predisposed to development of asthma, and for the modulation of gene
CC   activity in vivo for prophylactic and therapeutic purposes. The ASTH1
CC   protein is useful as an immunogen to raise specific antibodies, in drug
CC   screening for compositions that mimic or modulate ASTH1 activity or
CC   expression, including altered forms of ASTH1 protein, and as a
CC   therapeutic. Sequences AAZ18643-Z18685 intron/exon junction sequences of

PT   High-density gene chip making process.
XX
PS   Example 1; Fig 15; 19pp; Chinese.
XX
CC   The present invention describes a method which comprises making a high-
CC   density gene chip, specifically for making high-density micro-array of
CC   oligonucleotide probes. An oligonucleotide probe selecting process to
CC   seek preferentially length variable and coverage variable probes is
CC   provided to ensure identical cross melting temperature of probes to the
CC   maximum limit, and this can make the cross control of gene chip
CC   relatively simple and raise the reliability of the gene chip detecting
CC   results. The process proposes a specific probe selection method for
CC   detecting target sequence directly, detecting mutation in both specific
CC   and non-specific sites and a probe overall arrangement scheme. AAA79738
CC   to AAA80201 represent oligonucleotide probe sequences which are used in
CC   examples from the present invention

PT   New antisense compound for inhibiting the expression of signal transducer
PT   and activator of transcription 3 (STAT3) in cells or tissues and treating
PT   diseases or condition associated with STAT3, such as rheumatoid arthritis
PT   and cancer.
XX
PS   Example 2; Page 47; 104pp; English.
XX
CC   The present invention describes an antisense compound (I), 8 to 30
CC   nucleobases in length, that is targeted to a nucleic acid molecule
CC   encoding STAT3 (Signal Transducer and Activator of Transcription) and
CC   which inhibits the expression of it. (I) has antiinflammatory,
CC   antirheumatic, cytostatic and immunostimulatory activities. (I) is used
CC   for inhibiting the expression of STAT3 in cells or tissues, treating an
CC   animal having a disease or condition associated with STAT3 or a human
CC   having a disease or condition characterised by a reduction in apoptosis,
CC   and inducing apoptosis in a cell. Diseases or conditions that are treated
CC   are rheumatoid arthritis, cancer of the breast, prostate, brain, head
CC   and/or neck, leukaemia, myeloma, melanoma or lymphoma. (I) can also be
CC   used for diagnostic methods in detecting and determining the role of
CC   STAT3 in various cell functions, physiological processes and conditions
CC   and for diagnosing the conditions associated with expression of STAT3.
CC   (I) can be used alone or with other drugs as an immunostimulator. (I) is
CC   used in sandwich and colourimetric assays, involving enzyme conjugation
CC   and radiolabeling and is used in diagnostic kits. AAC93150 encodes human
CC   STAT3 and AAC93231 encodes mouse STAT3 as given in the exemplification of
CC   the present invention. AAC93151 to AAC93230 and AAC93232 to AAC93299

PT   New nucleic acids other than naturally occurring chromosomes encoding
PT   ASTH1 protein, for e.g. screening compositions that modulate expression
PT   or function of ASTH1 proteins or as diagnostics for genetic
PT   predisposition to asthma.
XX
PS   Example; Col 38; 131pp; English.
XX
CC   The invention relates to the ASTH1 locus on the short arm of human
CC   chromosome (11p). This locus comprises the ASTH1I and ASTH1J genes, which
CC   are associated with a genetic predisposition to asthma and bronchial
CC   hyperreactivity. The ASTH1I and ASTH1J genes are oriented in opposite
CC   directions with the ASTH1 locus, and have similar patterns of expression
CC   and common sequence motifs. They are both expressed in trachea, lung and
CC   several other tissues. ASTH1I and ASTH1J are novel members of the ets
CC   family of transcription factors, which have been implicated in the
CC   activation of a variety of genes including the TCRa gene and cytokine
CC   genes known to be important in the aetiology of asthma. Both ASTH1I and
CC   ASTH1J mRNAs are alternatively spliced. Alternative splicing of
CC   transcripts has no effect on the open reading frame of ASTH1J, as the
CC   exons involved are all 5' to the start codon in exon b. In contrast,
CC   alternative splicing of ASTH1I transcripts results in 3 different ASTH1I
CC   isoforms. The invention also encompasses mouse asth1j protein. The ASTH1
CC   nucleic acids are useful as diagnostics to identify a hereditary
CC   predisposition to asthma, as probes for identifying ASTH1 related genes,
CC   for identifying expression of the gene in a biological specimen, and for
CC   generating genetically modified non-human animals or site specific gene
CC   modifications in cell lines. The encoded ASTH1 proteins are useful as
CC   immunogens to raise specific antibodies; in drug screening for
CC   compositions that mimic or modulate activity or expression of ASTH1I
CC   and/or ASTH1J (including altered forms of these proteins); and as a
CC   therapeutic. The ASTH1 genes or fragments thereof, encoded proteins,
CC   ASTH1 genomic regulatory regions, and anti-ASTH1I and anti-ASTH1J
CC   antibodies are useful in the identification of individuals predisposed to
CC   development of asthma, and for modulation of gene activity in vivo for
CC   prophylactic and therapeutic purposes. The intact ASTH1I or ASTH1J
CC   proteins or active fragments thereof may be used to modulate or reduce
CC   bronchial hyperreactivity. Sequences AAA80571-A80594 represent the exon
CC   boundary regions of the human ASTH1J gene

CC   The present invention describes an antisense compound (I) up to 30
CC   nucleobases in length, where (I) inhibits expression of daxx (also known
CC   as Fas binding protein, CENP-C binding protein, dap6 for death associated
CC   protein 6 and EAP for Ets-1 associated protein). (I) has cytostatic and
CC   antiinflammatory activity, and can be used in antisense therapy and as a
CC   modulator of daxx. (I) is useful for inhibiting the expression of daxx in
CC   cells or tissues in vitro. (I) can be utilised for diagnostics,
CC   therapeutics for the treatment of diseases associated with the expression
CC   of daxx, prophylaxis e.g. to prevent or delay infection, inflammation or
CC   tumour formation and as research reagent. The present sequence represents
CC   an inhibitory human daxx antisense phosphorothioate oligonucleotide which
CC   is used in the exemplification of the present invention

PT   Novel antisense compounds targeting nucleic acid encoding groEL or groES
PT   gene of microorganism, which hybridize with and inhibit expression of the
PT   genes, useful to inhibit growth of microorganism having the genes.
XX
PS   Claim 3; Page 46; 110pp; English.
XX
CC   The present invention specifically claims AAH56368 to AAH56832 which are
CC   antisense oligonucleotides to nucleotide sequences encoding groE. More
CC   generally, antisense compounds (I) comprising antisense oligonucleotides
CC   of 5-50 bases targeted to a nucleotide sequence encoding groEL (heat
CC   shock protein (HSP)60) (GL) and groES (HSP10) (GS) gene from a
CC   microorganism, where the antisense compound is complementary to GL or GS
CC   of a microorganism and specifically hybridises with and inhibits the
CC   expression of GL or GS, is claimed. (I) have antibacterial, antiviral and
CC   antiproliferative activities, and can be used in antisense therapy and
CC   for inhibition of expression of groES or groEL. (I) are useful for
CC   inhibiting expression of GL or GS in cells or tissues in vitro. (I) are
CC   also useful for inhibiting the growth of a microorganism, or inhibiting
CC   the expression of GL or GS gene in a microorganism (a bacterial cell or a
CC   virus) having a GL or GS gene which involves administering to the
CC   microorganism or to a cell infected with the microorganism, (I). (I) are
CC   also useful for treating a mammalian pathological condition mediated by
CC   the microorganisms which involves identifying a eukaryotic organism
CC   having a pathological condition mediated by microorganisms having a GL or
CC   GS gene and administering (I) such that the growth of microorganism is
CC   inhibited. The antisense compounds are utilised for diagnostics,
CC   therapeutics, prophylaxis and as research reagents and kits, e.g., to
CC   prevent or delay microbial infections in humans. They are also useful as
CC   molecular weight markers. AAH56362 to AAH56367 and AAH56833 to AAH56854
CC   represent PCR primers for groE sequences which are used in the
CC   exemplification of the present invention. AAH56855 to AAH56870 represent
CC   groE nucleotide sequence given in the present invention

PT   New antisense compound to inhibit caspase 3 is useful for treating
PT   hepatitis and atherosclerosis.
XX
PS   Claim 3; Page 87; 127pp; English.
XX
CC   The present sequence for human caspase 3 antisense oligonucleotide 108988
CC   is 1 of various novel antisense oligonucleotides (AAS10517-AAS10676)
CC   described in the present invention. Also described are methods of using
CC   these compounds for the modulation of caspase 3 expression. The caspase 3
CC   antisense oligonucleotides specifically hybridise with and inhibit the
CC   expression of caspase 3. Antisense compounds targeted to caspase 3 are
CC   useful to inhibit caspase 3 expression in cells or tissues and to
CC   modulate apoptosis. The caspase 3 antisense oligonucleotides are useful
CC   for treating disorders associated with expression of caspase 3. Such
CC   disorders include hyperproliferative disorders (e.g. cancer), viral
CC   infections (e.g. hepatitis), haematopoietic disorders, autoimmune
CC   disorders, atherosclerosis and neurological disorders (e.g. Alzheimer's
CC   disease)

PT   New antisense compounds capable of modulating expression of human protein
PT   phosphatase 1B, useful for diagnosis, prophylaxis and treatment of
PT   diseases associated with expression of protein phosphatase.
XX
PS   Claim 1; Col 51-52; 71pp; English.
XX
CC   The invention is directed to antisense compounds, particularly
CC   oligonucleotides which are targetted to a DNA encoding protein
CC   phosphatase 1B (PTP1B) to modulate its expression. The antisense
CC   compounds are useful for diagnosis, prophylaxis and treatment of diseases
CC   associated with the expression of PTP1B, to prevent or delay infection,
CC   inflammation and tumour formation and as a research reagent. The PTP1B
CC   DNA is useful in gene therapy. The present sequence is an antisense
CC   oligonucleotide with a phosphorothioate backbone. This oligo is targetted
CC   to rat PTP1B to inhibit its expression

PT   Predicting the potential of an oligonucleotide to hybridize to a target
PT   nucleotide sequence, useful for evaluating oligonucleotide probe
PT   sequences, by identifying a oligonucleotides based on the evaluation of
PT   parameters.
XX
PS   Example 2; Col 59; 342pp; English.
XX
CC   The present invention describes a method for predicting the potential of
CC   an oligonucleotide to hybridise to a (complementary) target nucleotide
CC   sequence, involving identifying a subset of oligonucleotides within the
CC   predetermined number of unique oligonucleotides based on the evaluation
CC   of the parameter. Oligonucleotides in the subset are identified that are
CC   clustered along a region of the nucleotide sequence that is hybridisable
CC   to the target nucleotide sequence. This is useful for evaluating
CC   oligonucleotide probe sequences. The present sequence is an
CC   oligonucleotide described in the exemplification of the invention.

PT   Novel antisense compound useful for treating and diagnosing inflammatory
PT   diseases and cancers, is targeted to a nucleic acid molecule encoding
PT   signal transducer and activator of transcription proteins.
XX
PS   Example 2; Page 13; 21pp; English.
XX
CC   The invention relates to antisense compounds targeted to a nucleic acid
CC   molecule encoding a signal transducer and activator of transcription
CC   (STAT) protein, specifically STAT3, where the antisense compounds inhibit
CC   the expression of STAT3. The antisense sequences are useful for
CC   inhibiting the expression of STAT3 in cells or tissues, inducing Fas-
CC   mediated apoptosis in cells, and sensitising cells to apoptosis. They are
CC   also useful for treating an animal having a disease or condition
CC   associated with STAT3. These disorders include inflammatory or autoimmune
CC   disease, particularly rheumatoid arthritis, cancers, such as those of the
CC   breast, prostate, brain and head and neck and leukaemias, myelomas,
CC   melanomas and lymphomas. Also treatable are human diseases or conditions
CC   characterised by a reduction in apoptosis or an insensitivity to
CC   apoptotic signals. The sequences of the invention can be used in clinical
CC   research, for detecting and determining the role of STAT3 in various cell
CC   functions and physiological processes and for diagnosing conditions
CC   associated with the expression of STAT3. The sequences represent cDNA
CC   encoding human STAT3 and human STAT3 oligonucleotides

PT   Novel isolated polypeptide comprising variant form of mouse or human SAC1
PT   polypeptide, and is associated with altered preference for carbohydrates
PT   or other sweeteners, useful for preventing obesity, diabetes, alcoholism.
XX
PS   Claim 14; Page 88; 239pp; English.
XX
CC   The invention relates to an isolated polypeptide, comprising a variant
CC   form of mouse or human SAC1 polypeptide. The variant form is associated
CC   with altered preference for carbohydrates, other sweeteners or ethanol.
CC   The polypeptide and its associated DNA sequence can be produced by
CC   recombinant techniques and is useful for preventing obesity, diabetes or
CC   alcoholism associated with SAC1 expression. The sequences are useful in
CC   screening for drugs and sweeteners. Recombinant cell lines and transgenic
CC   embryos may be used in screening for and identifying agents that induce
CC   or repress function of SAC1. Predisposition to diabetes, obesity or
CC   alcoholism can be ascertained by testing any fluid or tissue of a human
CC   (such as blood, pancreas or tongue) for sequence variations of the SAC1
CC   gene. A sequence variation of the SAC1 locus may indicate a
CC   predisposition to diabetes, obesity and/or alcoholism and may provide a
CC   diagnostic mark. The polynucleotide can be detected in a biological
CC   sample by contacting the DNA with a probe to form a hybridisation complex
CC   which is then detected. The sequences represent cDNA encoding human and
CC   mouse SAC1 polypeptides and PCR primers specific for the SCA1 genes

PT Novel antisense compound useful for treating inflammation,
PT hyperlipidemia, and cardiovascular disorders such as atherosclerosis and
PT myocardial ischemia, inhibits Lysophospholipase I.
XX
PS Claim 3; Page 79; 131pp; English.
XX
CC The invention relates to an antisense compound (I) 8-30 nucleobases in
CC length targeted to a nucleic acid molecule encoding lysophospholipase I
CC (II), where (I) specifically hybridises with and inhibits the expression
CC of (II). (I) is useful for inhibiting the expression of (II) in cells or
CC tissues, and for treating a human having a disease or condition
CC associated with Lysophospholipase I e.g. inflammation, hyperlipidaemia,
CC and cardiovascular disorders such as atherosclerosis and myocardial
CC ischaemia. (I) is useful as research reagent and diagnostics. (I) is also
CC useful for distinguishing functions of various members of a biological
CC pathway. (I) is useful in antisense gene therapy. ABK37028-ABK37191
CC represent lysophospholipase I coding sequences, antisense
CC oligonucleotides and related PCR primers of the invention. Note:
CC Antisense oligonucleotides are modified such that bases 1-5 and 16-20 are
CC 2'-methoxyethyl (2'-MOE) nucleotides, all bases have phosphorothioate
CC linkages, and all cytidines are 5-methyl cytidines

PT   Inhibiting angiogenesis in a subject, involves administering at least one
PT   antiangiogenic nucleic acid molecule to the subject.
XX
PS   Claim 2; Page 33; 276pp; English.
XX
CC   The invention relates to inhibiting angiogenesis in a subject, comprising
CC   administering at least one antiangiogenic nucleic acid molecule. Also
CC   included is a kit comprising a first container housing the antiangiogenic
CC   nucleic acids, and instructions for administering them to a subject
CC   having a condition characterised by unwanted angiogenesis. The method is
CC   useful for inhibiting angiogenesis associated with solid tumour growth,
CC   tumour metastasis, precancerous lesion, rheumatoid arthritis, psoriasis,
CC   diabetic retinopathy, retinopathy of prematurity, macular degeneration,
CC   corneal graft rejection, neovascular glaucoma, retrolental fibroplasia,
CC   rubeosis, Osler-Webber Syndrome, myocardial angiogenesis, plaque
CC   neovascularisation, telangiectasia, haemophiliac joints, angiofibroma,
CC   wound granulation, intestinal adhesions, atherosclerosis, scleroderma and
CC   hypertrophic scars. The present sequence is an antiangiogenic nucleic
CC   acid of the invention

PT   New antisense oligonucleotides targeted to nucleic acid encoding Protein
PT   Phosphatase 2 catalytic subunit beta, useful for treating diseases
PT   related to Protein Phosphatase 2 catalytic subunit beta expression, such
PT   as cancer.
XX
PS   Example 15; Page 95; 137pp; English.
XX
CC   The invention relates to a novel compound 8-50 nucleotides in length
CC   targeted to a nucleic acid molecule encoding a protein phosphatase 2
CC   catalytic beta subunit, where the compound specifically hybridises with
CC   and inhibits the expression of protein phosphatase 2 catalytic beta
CC   subunits, or specifically hybridises with at least an 8-nucleotide
CC   portion of an active site on a nucleic acid molecule encoding a protein
CC   phosphatase 2 catalytic beta subunit. The antisense compounds are useful
CC   for modulating the expression of protein phosphatase 2 catalytic beta
CC   subunits and for treating diseases or conditions associated with
CC   expression of protein phosphatase 2 catalytic beta subunits, e.g.
CC   aberrant insulin regulation or diabetes or a hyperproliferative disorder,
CC   particularly cancer. The antisense compounds are also useful for
CC   diagnostics, therapeutics, prophylaxis, e.g. to prevent or delay
CC   infection, inflammation or tumour formation, as research reagents and
CC   kits, and in distinguishing between functions of various members of a
CC   biological pathway. This polynucleotide sequence represents an
CC   oligonucleotide inhibitor of human protein phosphatase 2 catalytic beta
CC   subunit mRNA levels of the invention. NOTE: This oligonucleotide contains
CC   phosphorothioate residues and has 2'- MOE wings with a deoxy gap
